EDITORIAL NOTE

IN these days when the whole world is so closely linked together, and when newspapers make us as well acquainted with the doings in "far Cathay" as with those across the way, the lessons in geography taught by war in a distant land are learned far more effectively by young and old than they were ever learned from school books. This was never so fully demonstrated as in the case of Manchuria; a country practically unheard of until the last two wars which Japan had to fight. The easy fall of Port Arthur, when held by the Chinese and its stubborn defense by the Russians, turned the eyes of the world to the citadel which lay at the point of the far Eastern peninsula called Manchuria, and people for the first time became aware of its existence.

Subsequent events have given it an added interest, especially to American manufacturers, and to pioneers of business enterprise of all kinds. Lying south-east of Eastern Russia and north-east of China proper it is easily approachable by sea. The building of the Trans-Siberian Railway through Siberia and of the Chinese Eastern Railway connecting Mukden and Port Arthur has disclosed to the world the immense wealth of this province. One of the most important causes of the war between Russia and Japan was the claim on the part of the former to special exclusive rights of mining, timbering, etc., in this wealthy region, and the right to continue

EDITORIAL NOTE

the control existing since the Boxer outbreak in 1900. The Japanese fought not only for the independence of Korea but for the right to trade in Manchuria. In other words they fought for the "open door" for trade and commerce in Manchuria. In Manchuria is a population of about twenty millions engaged in a number of productive industries. Its agriculture is varied; cereals of all kinds, wheat, corn, millet, buckwheat, pulse, fibre-yielding plants, dye plants, opium, ginseng, and other medicinal plants, and vegetables and fruits in abundance are grown in Manchuria. Silks, furs, and skins are produced in large quantities and the land is rich in the precious minerals as well as in the more common and more useful ones. The people are becoming alive to the value of the goods manufactured by the outside world, and Manchuria, in the near future, will be a great field for American industry and enterprise.

The wonders of Manchuria, its recent history and its people, its resources and its trade are set forth in the following pages in a fascinating manner by Sir Alexander Hosie, who is at present Consul-General for Great Britain at Tientsin, having been a resident of China for practically forty years. He has an intimate knowledge of the spoken and written Chinese language dialects as well as the Manchurian tongue, and he is regarded as an undisputed authority on questions relating to Manchuria.

CHARLES WELSH.

THE PEOPLE, PRODUCTS, TRADE, AND
RECENT HISTORY OF MANCHURIA

BY ALEXANDER HOSIE

MANCHURIA

CHAPTER I

BOUNDARIES, PHYSICAL FEATURES AND CLIMATE

MANCHURIA, or the Tung-san-shêng (Three Eastern Provinces), as it is called by the Chinese, is an agglomeration of petty Tartar or Manchu principalities, lying to the north-east of China Proper and east of Mongolia, which were conquered one after another and welded into one kingdom during the sixteenth and seventeenth centuries by a Manchu chieftain named Nurhachu and his successors, who, pushing south and west from their ultimate capital, Mukden (lat. $41^{\circ} 46'$ N. and long. $123^{\circ} 37'$ E.), overthrew the great Ming dynasty and seated themselves on the throne of China at Peking in the year 1644, under the name of Ta Ch'ing Ch'ao (The Great Pure Dynasty). Kuang Hsü, the ninth Emperor — Shun Chih being the first — of that dynasty, now reigns; but what the primitive Manchu weapons effected in China in the beginning of the seventeenth century the rude agricultural implements of the Chinese are accomplishing in Manchuria at the present day. Since the establishment of the Manchu dynasty, however, this field for

MANCHURIA

Chinese enterprise and expansion has been very much curtailed. When the Manchus were struggling with China the Russians were settling on the banks of the Upper Amur and in the neighbouring regions, which then constituted part of Northern Manchuria. This encroachment, which was naturally resented, gave rise to a conflict, which resulted in the Treaty of Nerchinsk in 1689, wherein the boundaries of the two Empires are laid down. The preamble of that Treaty distinctly states that it was concluded "in order to repress the insolence of certain rascals who, making hunting incursions beyond the limits of their territories, pillage, murder, and stir up trouble and quarrels, as well as to determine clearly and distinctly the boundaries of the two Empires of China and of Muscovy."

Notwithstanding the various discrepancies which occur in the texts of this Treaty, it may be assumed that the boundary of Russia and Northern Manchuria was intended to be the Argun and Gorbitza Rivers and the Yablonoi Mountains from the source of the latter rivers to the sea. Passing over the treaties of 1727, 1768, and 1851, which do not concern the boundaries of Russia and Northern Manchuria, I come to the Treaty of Aigun (Ai-h'un), concluded in May, 1858, the first article of which deals with these boundaries.

The French text of this Treaty gives the Amur from the Argun River to the sea as the northern boundary of Manchuria, whereas the Chinese text cedes the left banks of the Amur and the Sungari to the entrance

BOUNDARIES

of the latter into the sea. As, however, the Sungari enters the Amur and not the sea, and as Russia has not claimed the left bank of the Sungari, it may, I think, be taken for granted that the Sungari has been inserted in the Chinese text by mistake. By this Treaty, therefore, the whole of the country between the Yablonoi Mountains and the Amur fell to Russia, and the territory between the Ussuri and the sea was placed under the jurisdiction of both countries, pending, according to the French text, a delimitation of the frontier. The Chinese text is silent on the subject of this delimitation; but little delay occurred in giving effect to it, for in November, 1860, and in accordance with Article IX. of the Treaty concluded at Tientsin on the 13th of June, 1858, a Supplementary Treaty was made at Peking and ratified at St. Petersburg in December of the same year. Article I. of this Treaty defines the whole of the frontier line of Russia and Manchuria with the exception of the western boundary of Northern Manchuria, already defined in Article II. of the Treaty of Nerchinsk.

In virtue of this Treaty the boundaries of Russia and Manchuria were, in 1860, the Erguné (Argun) River on the west, the Amur to the Ussuri on the north, and a line from the mouth of the Ussuri to the mouth of the Tumên on the east. By Article I. of the Treaty of Aigun (Ai-h'un) the Amur, the Sungari, and the Ussuri Rivers were declared open to the navigation of Russian and Chinese vessels only — to the exclusion of the vessels of other foreign

MANCHURIA

countries; and this stipulation, without any mention of the exclusion clause, was confirmed by Article XVIII. of the Treaty of St. Petersburg, signed in February, 1881; but since 1689 the whole coast line of Northern and Central Manchuria has bit by bit fallen into the hands of Russia, and the only seaboard now remaining to the whole of Manchuria lies between the Ya-lu River (*i.e.*, Korea) and the Chinese province of Chihli.

The left bank of the Tumên River from the point at which the Russian and Chinese frontiers meet to its source near, and to the south of, the Ch'ang-pai Shan — the most famous mountain in this part of the country; a line from the source of the Tumên to the source of the Ya-lu River, which rises in the same range of mountains, and the right bank of the Ya-lu to its mouth constitute the remaining boundaries of Manchuria on the east and south-east. On the right and left banks of the Tumên and Ya-lu, respectively, and south of the line which is drawn between their sources is the kingdom of Korea. From the mouth of the Ya-lu to the Great Wall, Manchuria is bounded on the south by the Yellow Sea and the Liao-tung Gulf. On the west it is bounded by the north-eastern corner of the province of Chihli, Eastern Mongolia as far as the Dalai Nor Lake, and thence to the Amur by the Argun River to its junction with the Shilka. These boundaries include an area of about 360,000 square miles, divided into three provinces, called collectively, from their position to the east of China Proper,

BOUNDARIES

the Tung-san-shêng, or "Three Eastern Provinces," but individually known as Hei-lung-chiang or Tsi-tsihar, Kirin, and Fêng-t'ien, which is also referred to as Shêng-king and Liao-tung.¹ The names in common use, however, are Hei-lung-chiang, Kirin, and Fêng-t'ien, applied to the Northern, Central, and Southern provinces respectively, and in discussing these provinces I shall employ these three names only, and spare the reader the necessity of remembering a number of designations which, in the case of those unacquainted with China and the Chinese language, would inevitably lead to confusion.

Hei-lung-chiang, the Northern province, named after the Amur River,² which previous to 1858 flowed through it instead of, as now, forming its northern and eastern boundary, is separated from the Trans-Baikal province of Eastern Siberia by the Argun River as far south as the Dalai Nor Lake, and on

¹ The capital of the Southern province, generally known to foreigners by the Manchu name Mukden, is called by the Chinese Shên-yang, which is in reality the proper designation of the land on which the capital is built. Shêng-king is more applicable to the capital than to the province, which is correctly styled Fêng-t'ien, while Liao-tung refers to that part of the province which lies to the east of the Liao River, the country to the west of that waterway being known as Liao-hsi. Although the Head of the Provincial Government resident at Mukden is Military Governor of Shêng-king and other parts (têng-ch'u), he is at the same time Governor-General of the province of Fêng-t'ien.

² The Amur is called the Hei-lung-chiang (Black Dragon River), or simply Hei Ho (Black River), in Chinese, and the name is probably attributable to the black or dark peaty brown colour of its waters in spring, due to the melting of the mountain snows and of the thick ice which blocks navigation for six or seven months of the year. The Chinese name of the Sungari is Sung-hua Chiang (Pine-flower or Pine-decorated River).

MANCHURIA

the west from Mongolia by a line drawn from that lake to the junction of the Cholo with the Nonni River, and down the right bank of the latter to its confluence with the Sungari. From this point the Sungari to its junction with the Amur forms its southern boundary. Hei-lung-chiang has an area of about 190,000 square miles and is the largest of the three provinces. In the west a range of mountains, called the Great Hsing-an Range, runs north and south from the Amur into Mongolia, and in lat. 48° N. and long. 127° E. two ranges, known as the Little Hsing-an, meet, one going north to the west of Aigun, the other east towards the junction of the Sungari and the Amur. From these lesser ranges branch east and west and north and south. In the western range, and about sixty miles from the Argun River, rises the Nonni, the most important waterway flowing *through* the province. On its way to the Sungari, which it joins at Shui-shih-ying-tzû, twenty miles to the north of the town of Petuna (Hsin Ch'êng), it passes on its left bank the town of Mergen and Tsitsihar, known to the Chinese as Pu-k'uei, the capital of the province. It is navigable by large junks from the Sungari as far as the capital and by junks of light draught to Mergen. The only other waterways of any importance falling from the north into the Sungari are the Hulan and T'un Rivers. A number of streams flow northwards into the Amur. They are unnavigable, but of considerable importance commercially on account of the gold found in their sandy beds. The Amur and the Sungari are

BOUNDARIES

both navigable, and steamers of light draught ascend the former from Habarovsk, on the right bank of the Amur, at its junction with the Ussuri, to Pokrovskaia, a little to the east of the confluence of the Shilka and Argun, whose combined waters go to form the Amur. The Shilka, too, is navigable by steamers as far as Stretensk, and in favourable seasons to Mitrofanov, while the Argun is also navigated for over 700 versts, or 460 miles. The distance from Habarovsk to Stretensk is $2,115\frac{3}{4}$ versts, or $1,407\frac{1}{6}$ miles, and Mitrofanov $2,252\frac{1}{2}$ versts, or $1,501\frac{2}{3}$ miles, and if to this be added the distance ($939\frac{3}{4}$ versts) from Habarovsk to Nikolaevsk, near the mouth of the Amur, it will be found that the Amur and the Shilka together are navigated by steamers for $3,192\frac{1}{4}$ versts, or $2,128\frac{1}{6}$ miles. The Sungari, which falls into the Amur 241 versts, or $160\frac{2}{3}$ miles, above Habarovsk, is regularly navigated by steamers from its mouth to Petuna, a distance of 965 versts, or $643\frac{1}{3}$ miles, and I have seen a couple of steam launches even at the city of Kirin itself. The navigation on all these rivers is restricted to from May to October, for during the rest of the year they are ice-bound.

The mountain ranges of Hei-lung-chiang, which are mostly volcanic, are thickly clad with forests, and the agricultural area is as yet confined to the river valleys, especially those of the Nonni and Hulan. A great part of the south-west of the province is occupied by Mongols, who graze their herds on the grass-covered steppes, which still remain untouched by the hoe of the cultivator. Much of

MANCHURIA

this virgin soil is low lying, and liable to inundation during the rainy season in July and August. Emigrants from the south are, however, gradually pushing northwards in spite of official discouragement. Hei-lung-chiang is the Tasmania of China, and the unwilling immigrants are mostly Manchus who, if officials, have to do duty on the post roads at their own expense for a certain term of years, and, if common people, are handed over as slaves to the Manchu inhabitants, or left to find their own livelihood under official surveillance. As a rule, the ordinary criminals banished to Hei-lung-chiang never leave the province: many of them escape and turn brigands, terrorising and plundering the peaceably disposed traders and farmers. Criminal officials, on the other hand, sent to do duty in Hei-lung-chiang, usually succeed, after serving a portion of their sentence, in having the remainder remitted in consideration of a money payment for each year of the term unexpired. I shall have occasion to refer to the subject of brigandage later: suffice it to say in this place that it is the scourge of this, and of Kirin, the Central, province. A considerable part of the steppes of this province is, however, impregnated with soda and other salts and is unfit for cultivation. The extraction of the soda is an industry of Hei-lung-chiang, and the surplus manufactured article in the form of bricks or cakes is brought down to Tientsin and Newchwang, whence it is exported principally for use in the native dyeing and silk-reeling establishments in Northern China. The

BOUNDARIES

province is rich in gold in the north-west, north, and east, on the banks of the Amur and in the beds of its tributaries. The Mo-ho mines, where a native company, under Government license, has been at work since 1888, are the best known of the gold mines near the Amur. They are 70 *li*, or about 23 miles, south of the village of Mo-ho, and lie on the banks of a streamlet flowing into a small river which joins the Amur just below the Russian village of Albazin. Other mining camps on the south bank of the Amur are T'ai-p'ing-k'ou, between the Russian villages of Hingan and Pompeevka, and Kuan-yin-shan, opposite Raddevka. Previous to 1888 gold-washing was clandestinely carried on, and trouble arose owing to a large number of Russian subjects crossing the Amur and taking part in it. It was promptly suppressed by the Hei-lung-chiang authorities in 1887, and the mining was thereafter placed under Government control. A consignment of arms and ammunition was brought to Newchwang in 1896 under official pass by steamer from Tientsin for conveyance to the mines to ensure more efficient protection, and when I visited Mo-ho during the present year I was informed by the villagers that additional soldiers were expected to arrive soon. Gold is also found on the banks of the Sungari, and I shall refer to this when I come to deal with the province of Kirin. Copper and lead are also said to be found in the Northern and Central provinces of Manchuria; but, so far as Hei-lung-chiang is concerned, no locality is mentioned. Game abounds

MANCHURIA

in the mountains and on the steppes, and includes the tiger, bear, leopard, deer, antelope, roe-deer, and wild boar. Such animals, again, as the sable, squirrel, weasel, land-otter, wolf, hare, badger, wild-cat, and fox are hunted for their skins. Then comes winged game, including bustard, swan, goose, duck, black-grouse, wood-cock, partridge, pheasant, snipe, and quail. It sounds an excellent ground for the *shikari*, who, however, runs the danger of himself being hunted down by brigands or eaten up by venomous midges, mosquitoes, and gadflies. Herds of ponies, cattle, pigs, and sheep graze on the grassy steppes. From the above it will be concluded that the area under cultivation in the province of Hei-lung-chiang is not very extensive, and such is the case. Agriculture is at present confined for the most part to the small river valleys — in other words, to the country taken up by the Chinese colonists, who are gradually pushing their way northwards and settling down on this virgin soil. But with agriculture I shall deal afterwards, under the head of “Agricultural Products.” The Amur and the Sungari and their tributaries teem with a great variety of fish, including the sturgeon and trout, and in the autumn with incredible shoals of a species of salmon called *tamara*, which ascends these rivers to spawn.

Kirin, the Central province, lies to the south of Hei-lung-chiang, and is bounded on the north by a part of Mongolia, the Sungari from its junction with the Nonni to its mouth, and by the Amur to the

BOUNDARIES

mouth of the Ussuri; on the east by the Ussuri and its tributary the Sung-a-ch'a to its source, thence by a line drawn to Lake Hinka and across the lake to the mouth of the Pai-ling River, by a range of mountains lying between that point and the mouth of the Hu-pu-t'u, an affluent of the Sui-fên River, which enters the bay on which Vladivostock is situated, by a line from the mouth of the Hu-pu-t'u to the Hun-ch'un River, by the latter as far as a range of mountains lying between the Hun-ch'un River and the sea, and by this range to a point on the left bank of the Tumên River twenty Chinese *li* from its mouth; on the south by the Tumên River to its source, thence by a line to the source of the Ya-lu, and by that river to the village of Mao-êrh-shan, which lies on the right bank and within the southern province of Fêng-t'ien; on the south-west by a line running north-west from east of Mao-êrh-shan to the immediate south of Wei-yüan-p'u-mên in the Eastern Palisade, and to the north of the district city of K'ai-yüan, where one of the final struggles between the Chinese and the Manchus took place; and on the west by part of the province of Fêng-t'ien and Mongolia.

Kirin has an area of about 110,000 square miles. Its capital, also called Kirin or Ch'uan-ch'ang (Dockyard), lies on the left bank of the Sungari in lat. $43^{\circ} 49' N.$ and long. $126^{\circ} 46' 27'' E.$ The province is divided into three parts by the Sungari, the Hurka, and the Ussuri. I have already referred to the navigability of the Sungari, and steamers

MANCHURIA

ascend the Ussuri to Iman, 380 versts, or $253\frac{1}{2}$ miles, from Habarovsk at its mouth. By the first Article of the Treaty of Aigun, the navigation of the Amur, Sungari, and Ussuri is restricted to Russian and Chinese vessels. The number of steam-vessels engaged in towing and carrying passengers on these three rivers above Habarovsk is placed at one hundred and twenty, whereof eighteen fly the flag of the Chinese Eastern Railway Company, consisting of the Chinese flag with the Russian flag inserted in one of the corners, while the balance of over one hundred fly the Russian flag. I can safely say that along the whole course of the Amur I noticed little more than half-a-dozen Chinese junks in May and June of the present year. The section of the province to the west of the Sungari — an eastern prolongation of the Mongolian steppes — consists for the most part of fine level loamy soil well under cultivation and forming, so far as agriculture is concerned, the richest part of the province. This section contains the most important commercial part of Manchuria — the city of K'uan-ch'êng-tzŭ or Ch'ang-ch'un Fu, which lies eighty miles west of the capital, and is the collecting and distributing centre for exports from and imports to Hei-lung-chiang and Northern Kirin. Much of the northern part of the section between the Upper Sungari and the Hurka is still virgin steppe awaiting the hand of the Chinese cultivator, who is displacing the indolent and less practical Manchu farmer and trader throughout Manchuria. In the river valleys the husbandman is

BOUNDARIES

at work, but the south is given up to the Chinese trapper, lumberer, ginseng collector and grower, and the hunter for gold, who, scattered about among the Ch'ang-pai-shan ranges, are unfettered by Government control. The highest point of this range is the Ch'ang-(or Lao-)pai-shan, *i.e.*, "Ever-(or Old) White Mountain" (8,000 feet), so called from the pumice which surrounds its crater, wherein is a lake some six or seven miles in circumference more than 300 feet below the summit. The other lakes of Kirin are part of Lake Hinka and the A-pu Lake (Lake Birten), through which the headwaters of the Hurka flow to the south-west of Ninguta. The Ever-White Mountain is held sacred by the Manchu dynasty as the reputed birthplace of its founder Nurhachu. It is, however, no myth to say that it is the birthplace of three rivers—the Sungari, the Ya-lu, and the Tumên. The section between the Hurka and the Ussuri is far less developed and cultivated than the section between the Sungari and the Hurka. The right bank of the former, from the mouth of the latter eastward, is inhabited to a great extent by the Yü-p'i-ta-tzŭ, or Fish-skin Tartars, who derive their name from their clothing, which they manufacture from the skins of the Tamara salmon. Here, however, the banks of the Sungari are rich in gold, especially in the neighbourhood of the town of San-sing, which lies to the east of the Hurka at its junction with the Sungari. When in Kirin in 1869 I met, and had a long conversation with, a Taotai who was on his way to San-sing to

MANCHURIA

take up an appointment as director of a gold-mining company under Government license, and I have since heard that the results obtained by the company from washings average about thirty-six Chinese ounces, or three lb. avoirdupois, per day — sufficient to pay the wages of the employés, ensure the necessary protection to the workers, and leave a margin of profit to the shareholders. Gold is also worked on the Upper Sungari, in the valleys of the affluents of the Ya-lu near its source, and on both banks of the Hurka. Silver, associated with lead and copper, is worked in the south of the province. Coal is found in many places in Kirin, and in the capital it is placed in the market at from six to twelve shillings a ton according to quality. The inferior quality is very soft and burns rapidly. It comes down the Sungari. Coal is also found in the south-east and in the west of the province, and the Kirin Coal Company, which is under Government auspices, has opened up mines in the west at a place distant twenty miles from T'ung-chiang-tzŭ, the highest navigated point on the Liao River, on which the port of Newchwang stands. Foreign plant was purchased for the purpose, and was transported into the interior by cart during the winter of 1897-98. The usual trees met with by the traveller in Kirin are the willow and elm, with scrub-oak on the low hills and a sprinkling of pine; but the mountains of the province are covered with valuable forests of oak, elm, pine, walnut, birch, spruce, and plane, with dense undergrowth. The great lumber market of Manchuria is Ta-tung-k'ou,

BOUNDARIES

on the right bank of the Ya-lu near its mouth, whither huge logs from the Ch'ang-pai-shan ranges find their way down that river and its tributaries, especially the Hun or Tung-hua Chiang. Much red and yellow pine is floated down the Sungari to the capital, where it is used, not only for junk-building, but also, owing to its comparative cheapness, for the gigantic fencing of houses and compounds. On the left bank of the Sungari at Kirin I noticed several large caravansaries closely surrounded by stout logs of pine frozen vertically in the ice and as high as a hoarding at home. As might naturally be expected, these forests afford cover to game of all kinds, from the tiger and bear downwards. Wild boar, deer, antelope, pheasant, and partridge were all exposed for sale in a frozen state in the streets of Kirin during my stay there. Nor should I omit to mention a great variety of fish from the Sungari, which lay about in frozen heaps. Of these we found the sturgeon excellent eating. The game and fish remain good throughout the winter, and I afterwards saw them in many places through which we passed.

Fêng-t'ien, the Southern province, although the smallest of the three—having an area of about 60,000 square miles—is, owing to its proximity to China, comparatively well developed, and as it is the only province now possessing a seaboard, and a consequent outlet for nearly the whole produce of Manchuria, its importance from a commercial standpoint will be readily recognised. The boundary on the east is the Ya-lu from east of Mao-êrh-shan to its

MANCHURIA

mouth; on the south are the Yellow Sea, the Liao-tung Gulf as far west as Shan-hai-kuan, and part of the province of Chihli; on the west are Chihli and Mongolia, and on the north part of Mongolia and Kirin. A range of hills starting in the south of the Liao-tung Peninsula and running north-east to the province of Kirin divides Fêng-t'ien into two parts — the western or level, and the eastern or hilly section. In the latter a number of ranges extending to the Ya-lu run from the south of the province parallel to this range, while the western section forms the valleys of the Liao, the most important commercial waterway in Manchuria, which, rising in Mongolia, where it is known as the Sira-muren, flows south by west into the Liao-tung Gulf, passing on its left bank at a few miles from its mouth the open port of Newchwang — called locally Ying-kow and Ying-tzũ — of the Hun River, the Liao's most important tributary, and of several smaller rivers which also flow into the Liao-tung Gulf between the Liao itself and the Chinese frontier.

There are sulphur and other mineral springs between Hai-ch'êng and Liao-yang and in several other places in the province, but the sulphur is not extracted.

The hills of Fêng-t'ien are rich in carboniferous strata, more especially in the centre of the province to the east of the high-road between the port of Newchwang and Mukden. The coal mined there, called Liao-yang coal, from the name of the sub-prefecture within which it is found, is declared to

BOUNDARIES

be equal to the best Cardiff, and it is certainly excellent, but, owing to the constant flooding of the mines during the rainy season and the absence of pumping gear, the price per ton laid down at the port has risen from \$7 in 1893 to \$14, which is altogether prohibitive and bars all possibility of export. Coal also exists in the hills to the north-east of Mukden, in the west where the coal measures of Chihli extend into Fêng-t'ien, and in the east and south of the province. Peat is also found in the east of the Liao-tung Peninsula. Iron is worked within the district of T'ieh-ling, forty miles north by east of Mukden and in proximity to coal, as well as in other parts of the province; but the large supply of cheap old foreign iron which finds its way into Manchuria through the port of Newchwang competes successfully with the native manufacture. Gold exists in Fêng-t'ien, and works have been opened and abandoned: but it does not follow that lack of gold is the cause of the failure. One of the difficulties under which gold-mining labours in Manchuria recently came to my notice. The gold-mining company at San-sing, in the Kirin province, to which I have referred above, had in its employ and for its protection a force of 200 cavalry and 700 infantry. Two of the cavalry officers were captured by brigands, who demanded for their release a ransom of 300 and 200 ounces of gold-dust respectively. Is it likely, therefore, that where a protected company is attacked, private enterprise could succeed? An inferior kind of jade stone is quarried within the district of Hsiu-yen, some sixty

MANCHURIA

miles to the south-east of the port of Newchwang, and is exported in small quantities in the shape of carved ornaments. The hills to the east and south are of igneous formation, and excellent granite can be had. Towards the Ya-lu and to the north-east there are forests of splendid timber, affording cover to game of all kinds. Along the seaboard from the Ya-lu to Shin-hai-kuan there are, in addition to Newchwang, a number of ports, some of them open all the year round, where a considerable trade is carried on by native shipping.

The climate of Manchuria may be described as extreme. In the Hei-lung-chiang province the temperature falls as low as 49° below zero (Fahrenheit) in winter, and rises as high as 90° in summer. On the morning of the 19th of January, 1896, whilst I was in Kirin, the temperature fell to -34° in that city, and the average minimum from the 15th to the 28th of January was -20° . The maximum temperature in summer is about 95° . In Mukden the lowest reading in winter is about -28° , and the highest in summer about 96° . In the port of Newchwang the temperature was once as low as -17° during the winter of 1894-95, but in 1895-96 it only fell once below zero; in summer it rarely exceeds 85° . From the beginning of December to the end of March all water-borne traffic ceases to the north of Newchwang, the whole country being ice-bound during these four months. The ports in the south of the Liao-tung Peninsula are, however, open all the year round. In the north of Manchuria snow

BOUNDARIES

falls to a depth of two or three feet, while in Newchwang it rarely exceeds twelve inches. The summer heat of Manchuria is dry and easily endured, but the winter cold is intense, especially when a north-east wind blows. The rainfall is small, usually averaging about thirteen inches, half of which falls as a rule in the months of July and August. When the country is ice-bound the roads in the interior, bad at their best, are suitable for cart traffic; when it begins to thaw, and during the rainy season, the soft loam of which they are composed (I do not say made, for that would be a departure from truth) becomes a veritable quagmire, wherein animals are frequently suffocated or drowned. Climate, therefore, has a very important influence on the traffic of Manchuria, as I hope to show later when I come to deal with the trade of the country, and it will continue to exercise that influence until railways connect the three provinces and bring the remote districts of Hei-lung-chiang within as many hours of the Yellow Sea or Liao-tung Gulf as they now are days.

CHAPTER II

PEOPLE AND ADMINISTRATION

IT is not my intention to write a history of the Manchus — of their origin, their rise, and their conquests. What I wish to do is to lay before the reader a picture of Manchuria — of its people, administration, products, industries, and trade, — to call attention to its capabilities and resources, and to show how these capabilities and resources may be utilised and developed. In the preceding chapter I have dealt with its boundaries, physical features and climate, and in the present chapter I propose to discuss the people and administration of Manchuria.

Of the 17,000,000 inhabitants of the three provinces of Manchuria probably not more than ten per cent. are Manchus, and by Manchus I mean not merely the descendants of the various tribes which were welded into one kingdom by Nurhachu, but also the descendants of the inhabitants of the Northern province of Hei-lung-chiang, which was not brought completely under the sway of the present dynasty until 1671, as well as the descendants, called Han-Chün, of the northern Chinese, who assisted the Manchus in the conquest of China. All these — Manchus, Han-Chün, as well as the descendants

PEOPLE AND ADMINISTRATION

of Mongols, who also lent their aid — are known by the generic name of Ch'i Jên, or Bannermen. When the Manchus conquered the Chinese the great mass of the conquerors remained in China, where they were required to garrison their newly-acquired territory, and even now there are Manchu garrisons in several provinces of the Empire. The descendants of those who stayed at home are scattered over Manchuria from the Yellow Sea to the Amur; but the vast majority are to be found in the two provinces of Hei-lung-chiang and Kirin. There are, however, certain places in Fêng-t'ien, such as Fu Chou and Hsiung-yüeh (Hsiung-yao) in the Liaotung Peninsula, where Bannermen predominate, and in the chief Government centres, especially the capitals of the three provinces — Mukden, Kirin, and Tsitsihar (Pu-k'uei) — they are comparatively numerous. Mongols are sparsely scattered about in the south-west of Hei-lung-chiang and in the north-west of Kirin, but ninety per cent. of the seventeen millions of Manchuria are composed of the descendants of Chinese who had already settled in Southern Manchuria during the Ming Dynasty, and of immigrants from the northern provinces of China, who are annually on the increase.

Some people profess to be able to see at a glance numerous ethnological points of difference between Manchus and Chinese. If they are right my powers of observation must be exceedingly limited, for I am bound to confess that, in spite of frequent opportunities for comparison, I am unable to distinguish

MANCHURIA

a Manchu from a Chinese gentleman. They dress alike, and to all outward appearance they are members of the same family. With the other sex it is different. There can be no mistake about a Manchu lady. Her erect carriage, due, no doubt, to her natural feet, her distinctive coiffure and dress¹ at once mark her as non-Chinese. Notwithstanding

¹“The dress of Manchu women is in all its main points very similar to that of men — the same underclothing and similar loose flowing robes. Of these latter there are two, which differ slightly one from the other, the inner robe (*ch'en i*) having an unbroken skirt, and opening merely at the throat with a breast lappet fastening down the left side; the outer robe (*ch'ang i*) is similarly made, but has an opening (*k'ai chieh*) on either side, extending from the waist down to the hem. These robes being of figured gauze, silk, or satin, with a deep border of embroidery — some four inches wide — running along the skirt and central and side openings, present a very handsome appearance, which is increased by the deep cuffs, usually of some light-coloured silk, in contrast with the dark texture of the robe, embroidered in light colours with flowers or butterflies. Their feet are of the natural size, the shoes worn by those who have to go about on foot being much like men's ordinary shoes, of silk and satin embroidered, with flat soles. In the case of ladies, however, who when they go out do so in a chair or cart, the shoes stand upon a sole of four or six inches in height, or even more. These soles, which consist of a wooden frame upon which white cotton cloth is stretched, are quite thin from the toe and heel to about the centre of the foot, when they curve abruptly downwards, forming a base of two or three inches square. In use they are exceedingly inconvenient, but, like the long nails, with their metal sheaths of gold or silver, affected by Chinese ladies, they show the well-to-do position of the wearer. The Manchus are naturally a taller and finer race than the Chinese, and the artificial increase to the height afforded by these shoes gives them at times almost startling proportions.

“There is little difference between the private dress of ordinary Manchu women and that of those belonging to the official class. The latter, however, always have the two robes above described, while the former frequently, in lieu of the outer robe, wear a sleeveless bodice, either long, and reaching to the skirt of the robe (*kua la'rh*), or short, to the waist only (*k'an ch'ien*), with an embroidered border round the edges.” — *Illustrated Catalogue of the Chinese Collection of Exhibits for the International Health Exhibition, London, 1884*, pp. 13, 14.

PEOPLE AND ADMINISTRATION

her erect carriage, however, her gait is slovenly, and is due to the thick inelastic soles of her shoes. These traits are, properly speaking, not ethnological distinctions; but I have always been struck by the independent bearing and sprightliness of the Manchu lady in contrast to the timidity and insipidity of her Chinese sister.

Intellectually, however, the Manchu is no match for the Chinese. The former lacks the intelligence and capacity which are characteristic of the latter, and the recent replacing in many of the higher offices of the Empire of Chinese by Manchus cannot fail to be detrimental to the best interests of the country. As merchant or farmer, too, the Manchu lacks the business qualities and industry of the Chinese. This intellectual inferiority is due, in the main, to the grant by the State to the majority of Manchus of mature age of a monthly subsidy which, while keeping them from actual want, precludes that stimulus to earn a livelihood and better their condition which goes to make men and nations. In return for this subsidy the Government exacts a certain amount of military training from the recipients and their enrolment as reservists; but the system does serious harm, for it prevents the pensioner from leaving the neighbourhood of the pension office and turns him into a loafer, unless, indeed, he chooses the army as a profession and draws the pay of a regular. There are, for example, many Bannermen in the employ of foreigners at Peking; but, as there is considerable difficulty in drawing the Government subsidy *in*

MANCHURIA

absentia, they are, as a rule, unwilling to take service elsewhere even at considerably enhanced pay.

The Manchu language, unlike the Chinese, has no antiquity to boast of, and, at the present time, it is to all intents and purposes a thing of the past. In remote corners of the provinces of Kirin and Heilung-chiang, where Tartar tribes have kept themselves isolated and beyond the tide of Chinese immigration, it is still spoken, and proclamations in Chinese and Manchu are met with; but, with this exception, Northern Chinese is now the language of Manchuria. It is still taught in a desultory way, and in 1899 the Empress-Dowager sent special instructions to Mukden and Kirin calling upon the provincial authorities to raise the standard of education in the Manchu schools there and bring them into line with the schools of Peking. At the time when Nurhachu was carrying on his conquests in Manchuria and welding the various chieftainships into one kingdom there was no Manchu chirography, and recourse was had to Mongol as the intermediary in distant communications. Then it was that the necessity of possessing an independent written language was realised, and Nurhachu gave orders for its construction. This was accordingly done, Mongol being taken as the basis of the new writing. The Manchu language contains twenty-five letters or characters, six vowels and nineteen consonants, and the writing consists in drawing a straight line from top to bottom of the page and in adding on either side of the line with a Chinese pen

PEOPLE AND ADMINISTRATION

the strokes and curves necessary to form the letters and words. It embraces all the parts of speech, and is essentially a simple language, possessing, thanks to its constructors, only one gender. While in Chinese writing the reader begins at the top right hand corner of the page, in Manchu he starts at the top left hand corner, in both cases reading downwards.

The standard of education in Manchuria, from a Chinese point of view, is not of a very high order, and comparatively few literary honours have fallen to its inhabitants; but it must be remembered that the Chinese immigrants from Shantung and Chihli are exceedingly poor and illiterate, and, in the country districts, sparsely scattered over a very large area, so that educational facilities are not yet so well organised as in China Proper. Another reason is that, while the degree of licentiate may be obtained at Mukden, the provincial degree, which can be gained at the capital of each province in China, can, like the metropolitan degree, be competed for by the students of Manchuria only at Peking.

The administration of Manchuria was originally conducted on a purely military basis; but the southern province of to-day resembles in its form of government the provincial administration of China. There is a difference, however, and it is this. At Peking there are six Boards for the transaction, each in its own department, of all public business referred to them. They are: (1) Board of Civil Office, (2) Board of Revenue, (3) Board of Ceremonies, (4) Board of

MANCHURIA

War, (5) Board of Punishments, and (6) Board of Works. With the exception of the first, the Board of Civil Office, these Boards have their counterparts at Mukden, and each of the five Boards, established in 1631, is presided over by a vice-president, who, in his own special department, is a colleague of the head of the province, the Governor-General.

In 1644, the first year of the reign of Shun Chih, the first emperor of the present dynasty, the government of Shên-yang was entrusted to a Chamberlain of the Imperial Court in conjunction with two Deputy Lieutenant-Generals and a Military Secretary or Adjutant; in 1646 an An-pang (Amban) took their place; in 1662 the title of Amban was changed to that of Military Governor (Chiang Chün) of Liao-tung; in the following year to Military Governor of Fêng-t'ien; in 1671 to Military Governor of Shêng-king; and in 1876 the Military Governor was created Governor-General of Fêng-t'ien. As Military Governor he was, prior to 1898, Commander-in-Chief of all the forces within his province, with the exception of the garrison in the south of the Liao-tung Peninsula at Port Arthur and in its immediate neighbourhood, which was, for imperial purposes, under the control of the Superintendent of Trade for the Northern Ports, who is at the same time Governor-General of the Metropolitan Province of Chihli. In March, 1898, this garrison was, in accordance with Article IV. of the Port Arthur Agreement, withdrawn to make room for Russian troops, and it is now stationed between the Liao River and Shan-hai-kuan. With

PEOPLE AND ADMINISTRATION

this exception, then, the Military Governor is Commander-in-Chief of all the Banner and Chinese forces within the province of Fêng-t'ien. He is also High Commissioner in charge of the defences of the whole of Manchuria, and in this capacity, when the defences of Kirin or Hei-lung-chiang are concerned, he has as colleagues the Military Governors of these provinces.¹

It will be more convenient, however, to deal first with the civil administration. In 1657 Shên-yang was made a prefecture under the name of Fêng-t'ien Fu, which embraces the region enclosing Mukden, the capital, and a Civil Governor was appointed. Four years later the Civil Governor was further invested with the duties of Literary Chancellor; but in 1664 the office of Vice-Governor was created, and the post of Provincial Literary Examiner withdrawn from the Civil Governor and conferred on the Vice-Governor. In 1876 the Civil Governor was given the rank of a Provincial Governor in China, and as such he is a colleague of the Governor-General. The office of the latter at Mukden, where these three officials reside, consists of a number of departments — secretariat, clerical, official despatch receiving office, department of the five Boards (each of which, again, including its vice-president, has a staff of secretaries, writers, etc., ranging from twenty-three in the case of the Board of War to fifty-three

¹ By a decree issued in 1907 the three Provinces of Manchuria were placed under a Chinese Viceroy with a Governor in each province. All the new posts were placed in the hands of Chinese officials instead of Manchus to remove racial distinctions. — *Editor*.

MANCHURIA

in the Board of Punishments), military gendarmerie, police, paymaster, hunting ground, pasturage, stud and cart and goods tax offices. It would only weary the reader and serve no useful purpose to enter into details regarding the composition and duties of the staff of each Board. This chapter is intended to give merely a general description of the administration of Manchuria, the details of which would themselves fill a volume and occupy more time than I have at my disposal. I should not omit to mention here, however, that within the last few years offices for the consideration of international questions have been established at Mukden and Kirin (capital of the Central province). They are advisory bodies, each consisting of several official members, whose duty it is to consider and tender to the Governor-General and Military Governor respectively advice regarding such international cases arising in the two provinces as the Heads of the Government consider of sufficient importance to be referred to them for an opinion.

There are three Taotais or Intendants of Circuit in the province of Fêng-t'ien. They are the Yi Hsün Tao, stationed at Mukden, who to a great extent fills the position of Judicial Commissioner of a Chinese province; the Fêng-Chin-shan-hai Tao, who exercises territorial jurisdiction over the prefectures of Fêng-t'ien Fu and Chin-chou Fu and the city of Shan-hai-kuan to the immediate south of the Great Wall, and resides at Ying-kow, the port of Newchwang, where, in addition to being in charge of

PEOPLE AND ADMINISTRATION

the native Customs within his Intendancy, he is Superintendent of the Foreign Customs; and the Tung Pien Tao, or Intendant of the Eastern Frontier, who resides at the city of Fêng-huang T'ing, and has territorial jurisdiction over the sub-prefectures of Fêng-huang and Hsing-ching (or Hsing-king), the department of Hsiu-yen, and the four districts of T'ung-hua, Jên-huai, An-tung, and Kuan-tien. These three Intendancies were established in 1876, 1866, and 1877 respectively. A Taotai or Intendant of Circuit is, generally speaking, an official exercising administrative duties over two or more prefectures, with control over the military forces within his jurisdiction. The Yi Hsün Tao has no military control; the other two Intendants have.

A prefecture is a provincial sub-division administered by a Chih Fu or Prefect, who exercises control over the second-class sub-prefectures and districts which constitute his jurisdiction. There are three such prefectures in the province of Fêng-t'ien — Fêng-t'ien Fu, which embraces Mukden, the capital, established in 1657, Chin-chou Fu in 1665, and Ch'ang-tu Fu (Yü-shih-ch'êng-tzŭ) in 1877.

Next to prefectures come sub-prefectures, designated *T'ing*. There are six of these in Fêng-t'ien — Hsin-min T'ing (1798),¹ Hai-lung T'ing, Hsing-ching T'ing (1877), Chin-chou T'ing (1843) formerly called Ning-hai Hsien, Fêng-huang T'ing (1876), and Ying-k'ou T'ing (1866). The official in charge of

¹ The figures in parentheses represent the years in which the sub-prefectures, departments and districts were established.

MANCHURIA

the last is a maritime sub-prefect, who resides at the port of Newchwang, where he acts as police magistrate without territorial jurisdiction.

Then come departments (*Chou*), of which there are five — Fu Chou (1734), Hsiu-yen Chou (1876), Ning-yüan Chou (1664), Yi Chou (1734), and Liao-yang Chou, which, originally a prefecture, was reduced to a district when Fêng-t'ien Fu was established, and in 1664 raised to its present rank.

There are fourteen districts (*Hsien*), each with its district city and magistrate. They are: Ch'êng-tê Hsien (1664), the senior district because it contains Mukden, the capital, Hai-ch'êng Hsien (1653), Kai-p'ing Hsien (1664), once a department or *chou*, K'ai-yüan Hsien (1664), T'ieh-ing Hsien (1664), K'ang-p'ing Hsien (1876), Fêng-hua Hsien (Maimai-kai) (1877), Huai-tê Hsien (Ta-pa-chia-tzŭ) (1887), Kuang-ning Hsien (1665), Chin Hsien (1665), Tung-hua Hsien (1877), Huai-jên Hsien (1877), An-tung Hsien (1877) and Kuan-tien Hsien (1877).

Mr. Mayers, in his book on the Chinese Government, admirably expresses in a single paragraph the duties of prefects and magistrates. "They constitute," he says, "the general administrative body of the provincial civil service. They are charged with the collection of revenue, the maintenance of order, and the primary dispensation of justice, as well as with the conduct of literary examinations and of the Government postal service, and in general with the exercise of all the direct functions of public administration."

PEOPLE AND ADMINISTRATION

By Government postal service is meant the transmission of official documents; but there is, in addition to this, a courier department, with a head office at Mukden, for the conveyance of despatches along the main roads of the province. The staff at Mukden consists of a superintendent, assistant superintendent, and two second-class secretaries, with twenty-nine postmasters at different cities and places in Fêng-t'ien. In the interior of China and Manchuria ordinary correspondence has always been attended to by private native post-offices without Government control; but the Chinese Government have recently organised, through the Inspector-General of Customs, an Imperial Post, which, at first established at Peking and the open ports only, is now extending its operations further afield. Official pressure has been brought to bear on the native post-offices to compel them to transmit and receive through the Imperial Post all mail matter entrusted to them, and in Manchuria, with the port of Newchwang as a head office, branch offices of the Imperial Chinese Post had, up to the 10th of February, 1900, been opened at Chin-chou Fu and T'ien-chuang-t'ai on the road to Tientsin; at Kai-p'ing Hsien (Kai Chou), Hsiung-yao and Wa-fang-tien in the Liao-tung Peninsula; and at Hai-ch'êng Hsien, Niu-chuang, Liao-yang Chou, Mukden, T'ieh-ling Hsien, and K'ai-yüan Hsien on the main highroad from the port to the north. Other branches were soon to be opened at T'ung-chiang-tzŭ, Ch'ang-t'u Fu, K'uan-ch'êng-tzŭ (Ch'ang-ch'un Fu), and Kirin.

MANCHURIA

The district magistrate is the lowest territorial and administrative official; but at several important places in Fêng-t'ien there are assistant magistrates, who are directly responsible to the magistrate of the district within which they are stationed.

The above officials constitute the civil administration of Fêng-t'ien; but I should not omit to mention in a few words what may be termed the self-government of the country. Every village of any size contains one or more, and every town or city several, Headmen (Hsiang-yao), elected by their fellow-villagers and townsmen, and approved of by the civil local authority of the district. The duties of a Headman are many and varied. He is called upon to settle disputes among his constituents, to represent them in the case of litigation in local courts, and, in general, to be the intermediary between them and the civil power. He has at the same time to report whatever of importance occurs within his ward or constituency. For example, the magistrate numbers among his multifarious duties the office of Coroner, and the Headman has to report without delay every case of sudden or suspicious death, fatal accident or murder. In land transactions he is constantly in demand. His seal on a deed is a guarantee that the document is in order, that the lessor or seller is entitled to lease or sell the land to which the deed refers, and that the District Magistrate, who is also Land Registrar, may register the land and seal the deed without fear of future complications. I am here, more especially, referring to a lease or sale by

PEOPLE AND ADMINISTRATION

Chinese to foreigners, when more than usual care is taken as to the validity of the document.

The gentry and merchant guilds also play a prominent part in local government, their power and influence being much greater than is generally supposed. When Chinese from one province of China settle in another one of their first acts is to establish a guild or guilds in the centres where they reside. These, primarily formed for the protection of their members, gradually assume to themselves municipal functions, and for many reasons, chiefly financial, they are looked upon with favour by the local authorities. They can always be relied upon for contributions, and are useful bodies to conjure with when any scheme of betterment is propounded from without. The opposition of the gentry and guilds can always be cited as a powerful lever to block reforms and palliate inaction.

The port of Newchwang was opened to foreign trade by the Treaty of Tientsin of 1858, ratified at Peking on the 24th of October, 1860; but, prior to that date, Chinese traders from other provinces had settled in Fêng-t'ien, and guilds were already established by natives of Chihli, the San Chiang, Shantung, and Shansi at Mukden, of San Chiang, Shantung, Shansi, and Fuhkien at Kai-p'ing Hsien, of Shantung at Chin-chou T'ing, of Fuhkien at Kai-p'ing Hsien, and of Anhui at Chin-chou Fu. In the early days Mukden, Kai-p'ing Hsien and Chin-chou T'ing were the chief commercial centres; but, on the opening of Newchwang in 1861, trade left the old

MANCHURIA

channels and gravitated to the new port. The result was that clubs (Kung So), representing the San Chiang, Canton, and Fuhkien provinces, were inaugurated at Newchwang. These are supported by a voluntary tax on all goods imported and exported by the members. To each club is attached a mortuary, where the remains of members and fellow provincials are deposited pending their removal to their native places. When that terrific scourge, the bubonic plague, broke out in Newchwang in the summer of 1899 the victims were coffined and deposited in these mortuaries, and one of the great difficulties with which the International Sanitary Board had to contend was the removal of these centres of infection. Every possible pressure had to be brought to bear on the authorities before they could be induced to meddle with these clubs. Newchwang likewise possesses a guild of native merchants, which, besides performing the functions of a Chamber of Commerce, exercises the municipal duties of maintaining the streets, drains, and bridges, providing food and extra clothing to the necessitous poor during the long, severe winter, keeping in order the ponds for supplying the town with water, guarding commonalties and supplying theatrical performances and other entertainment to its members and the general public. It has authority to tax carts, shops and, to a certain extent, trade to enable it to fulfil these duties; but, although the taxes are rigidly levied, it cannot be said that the duties are faithfully carried out.

PEOPLE AND ADMINISTRATION

At Mukden there is another office, which, although dealing more especially with the provinces of Kirin and Hei-lung-chiang, must not be omitted. It is called the Wu-la Tsung-kuan Yamên, and exercises supervision over the hunters (Ta Shêng) and pearl-fishers (Ts'ai Chu) in Wu-la, the name of the country now included in the two northern provinces. Through this office tribute of furs, animals, etc., has to be sent annually to Peking, and presents of grain and clothing are made by it to the hunters and pearl-fishers.

The military administration of Fêng-t'ien is carried on by the Military Governor (Chiang Chün) of the province, assisted by four Military Deputy-Lieutenant-Governors, stationed at Mukden, Chin-chou T'ing, Hsing-ching (Hsing-king), and Chin-chou Fu; but, owing to the lease of the Kuan-tung¹ Peninsula to Russia, the forces at Chin-chou T'ing have been withdrawn and stationed elsewhere. The army of Manchuria is composed of "foreign drilled" Chinese troops and a Banner force, said to number 25,000 and 40,000 respectively. It is usual to considerably discount Chinese figures; but within the last two or three years active recruiting has been carried on, and I am inclined to think that these figures should be added to and not discounted. Indeed, the number of Mauser rifles imported into Manchuria through the port of Newchwang alone, for use in the Fêng-t'ien province, would suffice to equip an army of

¹ The name Kuan-tung is properly applicable to the southern part of the Liao-tung Peninsula.

MANCHURIA

about 40,000 men, and it must be remembered that the foreign drilled troops of the province, amounting to 8,000 men, are already provided with serviceable weapons. There is, besides, an arsenal at Mukden, where rifles of all sorts are manufactured, and quite recently the conversion of muzzle into breech-loading guns has been a specialty of the establishment. If one were to judge by battalions, the cavalry would appear to equal the infantry; but an infantry battalion numbers 500 men, while a squadron of cavalry numbers only some 200. A force of some thirteen battalions is stationed at Mukden, and the balance is distributed throughout the various cities of the province, where, in addition to their military duties, they act as bodyguards to the civil officials from the magistrate upwards, and as military police assist them in maintaining order.

The head of the province of Kirin is a Chiang-chün, or Military Governor, and the administration is practically on a military basis; but where Chinese have settled in numbers it has been found necessary to appoint civil officials. There is a Taotai at Kirin, and Prefects are stationed at Kirin and Ch'ang-ch'un Fu (K'uan-ch'êng-tzū), which is eighty miles to the west of the capital. There are independent Sub-Prefects at Pai-tu-na (or Pe-tu-na), Shuang-ch'êng, Pinchou, and Wu-ch'ang, a Department Magistrate at Yi-t'ung, and District Magistrates at Nung-an (Lung-wan) and Tun-hua (Ao-tun-ch'êng).

PEOPLE AND ADMINISTRATION

In addition to the Banner force, there is a foreign drilled force, said to number 10,000 men, under the command of six Military Deputy-Lieutenant-Governors, who have charge of certain divisions of the province. They are stationed at Kirin, Ninguta, San-sing (San-hsing), Pe-tu-na, A-shih-ho (Altch'ukha, and Hun-ch'un. The last is a special appointment, and the officer in command is charged with the defence of the frontier of Kirin bordering on the Russian Primorsk. There are forts at Kirin, Hun-ch'un, and San-sing, as well as an arsenal and powder mills at Kirin; but the value of the frontier defences may be gathered from the following description by a British military officer of the fort at San-sing, which he visited in 1897: "It is a ruin, but was originally a mud lunette, with just enough cement in it to hold it together for one or two inspections. The timber with which the magazines are lined is decayed and broken, the shot, shell, racers, pivots, etc., are rusty, and heaped up in the open like a pile of old iron. The only evidence that any attempt was ever made to mount a gun is a broken pivot and a burst hydraulic cylinder. The carriages are in a very bad condition, but the guns themselves, though lying in the open, are serviceable."¹ It is hardly surprising that this fort fell with ease into the hands of the Russians during their recent invasion of Manchuria. I should have mentioned that the fort between the port of Newchwang and the mouth of the Liao River in the Fêng-t'ien province was dismantled by the Jap-

¹ *Parliamentary Paper, China*, No. 1 (1889), p. 55.

MANCHURIA

anese in 1895 and the guns carried off or destroyed. It was not again equipped.

Although Fêng-t'ien has recently been very much disturbed by bandits, mounted and on foot, in the south-west of the province, Kirin is, *par excellence*, the province of outlaws and ex-soldiers, who, well mounted and armed, collect into bands, and, issuing from their mountain fastnesses, especially in the east and north-east of the province, swoop down on villages, caravans of goods and travellers, and plunder and rob without mercy. Even the great trade highways of the provinces are infested with them. Officials are sometimes carried off and held to ransom. There can be little doubt that these brigands have agents in the principal towns who keep them informed regarding the movement of treasure and valuables, and I understand that the Russians have recently had considerable trouble in forwarding silver to pay the workmen engaged on the Trans-Manchurian Railway in the neighbourhood of Ninguta, which is a favourite haunt of these outlaws. Indeed, brigandage in Manchuria has given rise to the establishment of private insurance offices throughout the country. These undertake for a commission the safe conduct of goods and treasure from one place to another. Each office supplies the trader with its own distinctive triangular scalloped flag, which is planted on each cart in the caravan, and a few armed men are sent as a nominal guard. It is generally understood that the insurance offices have to pay blackmail to the brigands to insure respect for their

PEOPLE AND ADMINISTRATION

flags, as the insurance guards are too weak to resist any determined attack. That they are sometimes attacked, however, is proved by the visits which they pay now and again to missionary hospitals for the purpose of having bullets extracted. The military forces of Kirin are kept busy hunting down these brigands, who, knowing that their capture means sudden death, fight with the greatest determination, and frequently inflict heavy losses on their would-be captors. Brigandage has practically become a profession in the Central province, and even in the Southern province, where it is less rampant, parents have been overheard discussing the advisability of fitting out their sons as highwaymen when everything else failed, and even a ragged mendicant bewailing his luck has been known to express the opinion that it would be far more profitable for him to be a brigand than a beggar, and that he only lacked the funds to procure an outfit. There are times when the Chinese authorities find it convenient to enter into a compact with these outlaws. An instance occurred during the war with Japan, when a brigand chief and his followers were induced to attempt the expulsion of the invaders of Manchuria. They were not a success.

Hei-lung-chiang is also presided over by a Military Governor, and the civil administration is at a discount. There are only two civil officials with territorial jurisdiction in the whole of the province. They are the independent Sub-Prefects of Hu-lan and Sui-hua (Pei-t'uan-lin-tzŭ), two places situated

MANCHURIA

in the Chinese-cultivated area to the immediate north of the Sungari.

There are six Military Deputy-Lieutenant-Governors stationed at Aigun, Mergen, Tsitsihar, Hu-lan, Hu-lun-pei-'rh (Khailar) and Pu-t'ê-ha, commanding, in addition to the Banner force of the province, a foreign drilled force of 7,000 Chinese. Besides their ordinary military duties they are engaged in the suppression of brigandage, which is rampant in the south of the province, and in the protection of the gold mines on the right bank of the Amur. There is a fort at Aigun on the Amur for the protection of the frontier.

The financial condition of Manchuria is a very intricate subject, and it is altogether impossible to arrive at figures which can be looked upon as reliable. The revenue is derived from the land tax, from which Manchus are exempt, contributions from salt, which is a Government monopoly, likin, and native customs duties on goods of all kinds, including native opium and lumber, levies on carts, licenses to opium dealers, distilleries, and native boats plying on the inland waters, taxes on sales of cattle, houses, and land, percentages on the output of gold, and last, but not least, part of the revenue of the Imperial Maritime Customs at the port of Newchwang. Annual subsidies are also contributed by several of the provinces of China in aid of frontier defence, and it is the constant wail of the High Authorities of Manchuria that these contributions are in arrear. There can be no doubt that there is a heavy expenditure for

PEOPLE AND ADMINISTRATION

military purposes; but a searching investigation into the finances of the three provinces would probably reveal serious losses to the provincial exchequers, and an absolute waste of much that is actually contributed to them.

CHAPTER III

RECENT EVENTS IN MANCHURIA

ON the third day of August, 1894, war was formally declared between China and Japan in consequence of disputes regarding the kingdom of Korea, and the battle of Phyönyang, on the 15th of September, and the naval engagement of Hai-yang, two days later, in both of which the Japanese military and naval forces were victorious, opened the way to the Japanese invasion of Manchuria by land and sea. Following up their successes against the Chinese troops in Korea the Japanese crossed the Ya-lu, the boundary of Korea and Manchuria, and occupied the city of Fêng-huang T'ing — usually called Fêng-huang-ch'êng — on the 30th. From Fêng-huang T'ing they pushed on to Hsiu-yen Chou and Hai-ch'êng Hsien, which were taken on the 18th November and 13th December, respectively. Some time was occupied in entrenching themselves at Hai-ch'êng and in repelling four different attempts made by the Chinese to retake the city, and it was not till the 4th of March, 1895, that the most desperate struggle in Manchuria was decided, and the inland town of Niu-chuang fell into the hands of the Japanese. These were the achievements of the First

EVENTS IN MANCHURIA

Army Corps. In the early days of November, 1894, the Second Army Corps landed at P'i-tzŭ-wo and Hua-yüan-k'ou, on the east coast of the Liao-tung Peninsula, north of Ta-lien-wan Bay, and took Chin-chou T'ing on the 6th, while next day the Japanese fleet occupied Ta-lien-wan Bay itself, the Chinese escaping to Port Arthur, which in turn was successfully assaulted and occupied on the 21st of November. On the 10th of January, 1895, two columns of the Second Army Corps took the city of Kai-p'ing Hsien, and the port of Newchwang (Ying-kow) was occupied on the 6th of March, the Chinese, with the exception of the troops in the forts who fled overnight across the frozen Liao, having evacuated the latter place the previous day and fallen back on T'ien-chuang-t'ai. The First and Second Japanese Army Corps now joined hands, and on the 9th of March, three days after the occupation of the port by the First Division of the Second Army, three divisions of the combined armies dealt a final blow at the Chinese forces at the town of T'ien-chuang-t'ai, on the right bank of the Liao, thirteen miles north of Newchwang, where the Chinese made their last stand in Manchuria. After the battle the Chinese retreated westwards, and the Japanese, leaving a few scouts to watch the movements of their beaten foe, withdrew to the left bank of the river. Japan had now overrun and occupied the whole of the Liao-tung Peninsula, and when the day of reckoning arrived it formed part of the territorial concessions by China; but Russia, France, and Germany made

MANCHURIA

representations to Japan, and she was induced to relinquish the fruits of her victory for a consideration.

A Convention between China and Japan for the retrocession of Liao-tung (Fêng-t'ien province) was signed at Peking on the 8th of November, 1895. As compensation for the retrocession of the southern portion of the province of Fêng-t'ien, the Chinese Government engaged to pay to the Japanese Government 30,000,000 Kuping taels on or before the 16th day of the 11th month of the 28th year of Meiji, corresponding to the 30th day of the 9th month of the 21st year of Kuang Hsü (16th November, 1895); and within three months from the day on which China paid to Japan this compensatory indemnity the retroceded territory was to be completely evacuated by the Japanese forces. The indemnity was duly paid, and on 30th November Japan commenced the evacuation of Manchuria, which was completed in the following month.

In the autumn of 1896 some surprise was caused in China by the publication in the Shanghai English press of a translation of what purported to be a Convention (known as the Cassini Convention) between Russia and China for the construction of a railway through Manchuria to connect the Trans-Baikal and Southern Ussuri sections of the Siberian Railway, and for the leasing to Russia of certain ports in Manchuria and China. As the conclusion of this Convention has been officially denied I will not reproduce it here; but in September, 1896, an

EVENTS IN MANCHURIA

Agreement was entered into between the Chinese Government and the Russo-Chinese Bank whereby, *inter alia*, the latter undertook to form a company, to be called the Chinese Eastern Railway Company, to construct a railway through Manchuria from the town of Chita, in the Trans-Baikal province, to a point in the Southern Ussuri Railway. The general terms of the agreement are that the shareholders of the said company shall be Russians and Chinese only; that the gauge shall be the Russian gauge of five feet; that work shall be begun within twelve months from the issue of an Imperial Decree giving assent to the agreement; that the railway shall be completed in six years from the date on which the land required for the line is handed over to the control of the Company; that on the expiration of eighty years from the completion of the line and the inauguration of the railway as a running concern the railway and all railway property shall pass, without payment, to the Chinese Government, who shall not be responsible for any losses which the Company may have sustained during that period; and that the Chinese Government have the right, at the expiration of thirty-six years from the inauguration of the railway as a going concern, to take over the railway on due payment, such payment to include the actual cost thereof, together with all debts and interest thereon, but any surplus, after payment to shareholders, shall be added to capital account and shall be deducted from the cost of the line to be paid by the Chinese Government.

MANCHURIA

In accordance with the above agreement the first sod of the Manchurian Railway was cut, with great ceremony, on the 28th of August, 1897, at a point on the eastern frontier of Kirin and the Primorsk. Chinese, Russian, and other officials were present, and telegrams announcing the inauguration of the railway were despatched to China and Russia. Work was now begun on the eastern and north-western frontiers of Manchuria, where lines 110 and 324½ versts respectively had to be built to reach the frontiers of Kirin and Hei-lung-chiang and connect with the Southern Ussuri and Trans-Baikal sections of the Siberian Railway at Nikolsk and Kaidalovo (not Chita, as originally intended), and engineers were sent into Manchuria to find the easiest route across that country. It must be borne in mind that Vladivostock, which would have been the eastern terminus of the Siberian Railway had Russia's railway programme been limited to the above, is closed by ice for several months of the year, and for this and other reasons, which need not be specified here, an Agreement between China and Russia was concluded on the 27th of March, 1898, by which China leased to Russia the ports of Port Arthur and Ta-lien-wan with the adjacent seas and a zone of territory around the ports for twenty-five years.

On the 28th of March, 1898, the day following the signature of the above Convention, the Russians occupied Port Arthur: the leased territory was subsequently defined by a line drawn from P'u-latien, at the head of an inlet on the west coast, to

EVENTS IN MANCHURIA

P'i-tzū-wo, a village on the west coast of the Liao-tung Peninsula, and the neutral zone was determined by a line drawn from the mouth of the Kai-chow River to the south of the district city of Kai-p'ing Hsien on the west coast to a point on the Ta-yang River and down its right bank to the sea and including the village of Ta-ku-shan on the east coast.

In the spring of 1898, when the Liao River opened, Russian engineers arrived at the port of Newchwang and selected at a spot about three miles higher up the river and on the same bank as the port a site for the terminus of a branch line, to act as a feeder for the line to be constructed to connect Port Arthur and Ta-lien-wan with the Trans-Manchurian Railway. This branch line, which goes east to Ta-shih-ch'iao, is about seventeen miles in length, and on its completion in 1899 the main line was commenced southwards to Port Arthur and northwards towards Mukden. The port of Newchwang was selected as a starting-point because a number of rock cuttings and a considerable amount of temporary bridging had to be carried out in the Liao-tung Peninsula, so that railway materials could not be pushed northwards from Port Arthur or Ta-lien-wan until they were completed. While, therefore, cutting and bridging were proceeding in the south, Chinese labourers from the provinces of Chihli and Shantung were busy building the embankments on the plain to the north and south of Ta shih-ch'iao, sleepers and rails from Japan and Russia respectively were brought in by steamers of various nationalities, and dragged

MANCHURIA

in trolleys along the branch line by ponies and oxen to Ta-shih-ch'iao whence they were distributed and laid under Russian supervision, and locomotives from the Baldwin Engineering Works, Philadelphia, were being landed and put together by Chinese artisans from Shanghai, Canton, and Hong-Kong under American supervision. It was not till the 6th of May, 1899, that the first small locomotive for construction purposes made a trial trip in the direction of Ta-shih-ch'iao and that steam-power was available along the branch feeding line. Faster progress was now made, and on the 23d of October, 1899, steam communication was established between Ta-lien-wan and the port of Newchwang. Later, the line from Port Arthur to Ta-fang-shên, where the track goes eastwards to Ta-lien-wan, was completed, and when the writer left Newchwang in April, 1900, that port was connected with Port Arthur and Ta-lien-wan in the south and with the city of T'ieh-ling, about forty miles to the north of Mukden, in the north. From Ta-shih-ch'iao northwards the line passes immediately to the west of Hai-ch'êng and Liao-yang, makes a considerable curve to the west of Mukden to avoid the imperial tombs of the ancestors of the present Manchu Dynasty, and then goes north to T'ieh-ling, which is the northern terminus of the southern section of the line from Port Arthur to the Trans-Manchurian Railway at Harbin, near the right bank of the Sungari in the province of Kirin. This line I shall call the Central Manchurian Railway to distinguish

EVENTS IN MANCHURIA

it from the Trans-Manchurian line from Vladivostock to Kaidalovo on the Trans-Baikal section of the Siberian Railway. I have said that the southern section of the Central Manchurian Railway was completed as far as T'iehling in April, 1900; but in many places the line is only temporary, and damage is constantly being done to the provisional wooden bridges spanning rivers like the Hai-ch'êng, T'ai-tzŭ, and Hun Ho, which rise during heavy rains and inundate the surrounding country. In connection with the southern section of the Central Manchurian Railway coal mines are worked to the east of the line at Lu-shêng, some three miles to the east of Wa-fang-tien in the Liao-tung Peninsula, where the recent daily output has averaged 150 tons, and shafts have been sunk at Mo-ch'i-shan and T'zŭ-êrh-shan, to the north-east of the city of Liao-yang, but no coal had been extracted up to April, owing to the flooding of the shafts. The coal from the former mines is dirty and requires cleaning and plant has been ordered for the purpose, while the latter are situated in the neighbourhood of valuable and excellent deposits. Branch lines are in course of construction to both mines. From T'ieh-ling the northern section of the Central Manchurian Railway will pass to the east of Ch'ang-t'u Fu and Fêng-hua Hsien, to the west and north of Ch'ang-ch'un Fu or K'uan-ch'êng-tzŭ, and then go north by east to Harbin, passing about eight and a half miles to the west of Shuang-ch'êng T'ing. The whole of the embankment on this northern section

MANCHURIA

has been constructed, and rails have been laid for some distance south of Harbin, whence it has been fed.

The first sod of the Trans-Manchurian Railway was cut on the 28th of August, 1897, and in the spring of the following year Russian engineers ascended the Amur and Sungari above the city of Hu-lan T'ing, and, landing on the right bank of the latter river, fixed upon a spot about seven miles inland for the junction of the Trans-Manchurian and Central Manchurian Railways. There was one solitary house — a Chinese distillery — on the spot at the time; but at the present moment Ha-êrh-pin, Ha-mo, or Harbin as is it now generally called, is a large town of several thousand inhabitants, consisting for the most part of Russians connected with, and for the protection of, the Trans-Manchurian Railway. Just as the port of Newchwang was selected as a suitable place whence the Central Manchurian Railway could be pushed north and south pending the completion of the necessary rock cuttings in the Liao-tung Peninsula, so Harbin was selected as the starting-point of the Trans-Manchurian Railway in Manchuria, because the east of the province of Kirin bordering on the Primorsk is exceedingly mountainous and presents serious obstacles to the railway engineer. To the west, again, and in the Hei-lung-chiang province, the Hsing-an range of mountains has to be crossed, and these two difficulties compelled access to be opened up with Central Manchuria by the Sungari and

EVENTS IN MANCHURIA

Harbin. The total length of the Trans-Manchurian Railway from Nikolsk, where it joins the Vladivostock-Habarovsk line, to Kaidalovo, where it joins the Trans-Baikal line, is about 1,580 versts, and if we add to this the 102 versts from Vladivostock to Nikolsk we have a total from Vladivostock to Kaidalovo of about 1,682 versts. From Harbin as a centre the Trans-Manchurian line is being pushed south-east and north-west, and at the end of April it had been constructed 160 versts on either side of the junction, to the south-east as far as Yi-mien-p'o, where a blank of nearly 200 versts separated it from the railhead of the line which has been built westwards from Nikolsk for a distance of 140 verst, only ninety-one of which were open for passenger traffic when I passed over the Southern Ussuri Railway on the 14th of May, 1900, and north-west towards the valley of the River Nonni, a tributary of the Sungari. As the valley of the Nonni is liable to inundation, special care is being taken in the construction of the line at this point, and pending the tunnelling of the Greater Hsing-an Mountains further west, which will occupy at least a couple of years, a temporary passage across the range is said to have been found. From the Hsing-an Mountains the line will go west, passing to the south of Khailar or Hu-lun-pei-'rh, and cross the Manchurian-Trans-Baikal frontier at Nagadan, and west across the Borza, Turga, Onon, Khila, Aga, and Ingoda Rivers to Kaidalovo. The construction of the Kaidalovo-Manchurian frontier railway was begun in 1897.

MANCHURIA

The total length of the bridging on the above rivers amounts to 2,606 feet, and the cost of this section, including permanent way, rolling stock, and bridging is placed at 28,323,158 roubles for a distance of 324 versts. The cost of the Nikolsk-Manchurian line, 110 versts in length, is similarly placed at 9,033,987 roubles; but I am unable to give an estimate of the cost of construction within Manchuria itself.

By Article VI. of the Russo-Chinese Agreement, already referred to, part of Ta-lien-wan Bay is set apart as a free commercial port. The site of the new town, named Dalny, has been fixed on the south shore of the bay, and a breakwater to shelter shipping from eastern gales and other works are now being built and carried out to render the new harbour safe and commodious. Some account of what is being done in regard to the town itself will be found in the next chapter. The distance from Dalny to Harbin by the Central Manchurian Railway is about 840 versts, making a total of about 1,959 versts from Dalny to Kaidalovo against about 1,682 versts from Vladivostock to Kaidalovo by way of Nikolsk and Harbin.

But there is another railway in Manchuria. When the writer took charge of His Majesty's Consulate in November, 1894, the Imperial Railways of North China had already reached the Great Wall, and a railway embankment had been built for some distance north of Shan-hai-kuan, which lies immediately to the south of the Wall. At that time it was intended to extend the line to Mukden by way of

EVENTS IN MANCHURIA

Chin-chou Fu, and even the city of Kirin was talked of as the objective. Funds, however, were wanting, and on occasions sums voted for the railway were withdrawn and appropriated to other purposes. Under these conditions progress was very slow, and, at the end of 1896, although the embankment was completed as far as the Ta-ling River, about twenty miles north-east of Chin-chou, only forty miles of rails were laid to the north of the Great Wall, as far as a place called Chung-hou-so. In 1898 some bridging had been done to the north of Chung-hou-so; but it became evident that if the proposed line were ever to be completed funds must be found for the purpose from more stable sources, and on the 7th of June, 1898, a Preliminary Agreement was made between the Chinese Administrator-General of Railways within and without the Shan-hai-kuan boundary and the Hong-Kong and Shanghai Banking Corporation for the construction of a railway line from Chung-hou-so to Hsin-min T'ing, and a branch line to Ying-tzŭ, and for the redemption of existing loans to the Tientsin-Shan-hai-kuan and Tientsin-Lu-kou-ch'iao lines.

Chung-hou-so is situated forty miles to the north of the Great Wall, and this and the extensions to Hsin-min T'ing and the port of Newchwang (Ying-tzŭ or Ying-kow), amounting to 258 miles, give 298 miles of Chinese railways built and projected in Manchuria. To this has to be added the projected branch to the Nan-p'iao coal mines, making a total length of 328 miles. The line from Chung-hou-so

MANCHURIA

to Newchwang was completed with temporary bridging early in 1902, and a certain amount of passenger traffic was being carried on between Tientsin and Newchwang when I left the latter in the beginning of April. At that time, too, the embankment of the extension to Hsin-min T'ing was completed from Kou-pang-tzŭ, about fifty-six miles from Newchwang and the place ultimately selected as the junction of the Newchwang and Hsin-min T'ing lines instead of Shih-shan-chan or Hsiao-hei-shan; but rails to complete the work had not yet arrived. I understand that the estimated cost of the extensions from Chung-hou-so to Newchwang and Hsin-min T'ing is put at taels 9,800,000, and of the branch to the Nan-p'iao mines at taels 1,000,000, a total of taels 10,800,000. These lines, together with certain improvements and additions to rolling stock, had to be completed by the 10th of October, 1901. These Chinese railways are built with the English gauge, and I have been assured by experts, who had no interest whatever in their success, that they are as strongly constructed as any English line.

The terminus of the Chinese railway is on the right bank of the Liao, below Newchwang, and Japanese and British Concessions have been secured to the east of the railway station, while the terminus of the branch line to the Central Manchurian Railway is three miles above the town, on the left bank, where a large Russian railway settlement has been built.

EVENTS IN MANCHURIA

There can, I think, be little doubt that the Russian Central Manchurian Railway, stretching from the Sungari to the commercial port of Dalny — a port open all the year round — will best serve the country to the east of the Liao and even the east of Mongolia, for, although the Chinese railway to the west of the Liao will pass through a fertile tract, that tract is limited, and even at Hsin-min T'ing it will still be far removed from the great agricultural centres to the north, which could more conveniently send their produce to stations on the Central Manchurian Railway. Moreover, the Chinese railway connects with Newchwang, Tientsin, and Ch'in-wang-tao, which are certainly ice-bound for varying periods in winter. If the Central Manchurian Railway succeeds in securing the bulk of the products for export at Dalny, it cannot, I think, fail to carry imports into the interior from that port, for, having travelled over the whole of the Siberian Railway to Moscow, I am of opinion that it will never be a highway for foreign goods intended for Manchuria and China. I may be wrong, but that is the conclusion at which I have arrived. It has been argued that the market of Manchuria is established at Newchwang, and that it is a very difficult matter to divert trade to a new channel. The argument would be perfectly sound if the permanent Chinese residents in Newchwang were the traders; but they are not. The bulk of the trade of Newchwang, whether in exports or imports, is done by Chinese merchants from the south, who reside at the port

MANCHURIA

during the open season and return home over winter. They are mere birds of passage, who flock to Newchwang because it is as yet the only port in Manchuria open to trade and steamer traffic; but when another port is opened, where trade can be carried on summer and winter, I see no reason why they should not resort to that port if they can pick up profits. Some people have pinned their faith to Ch'in-wang-tao, but it cannot be argued that the climatic conditions are as favourable as those of Dalny. Apart altogether from the rival claims of these ports to the trade of Manchuria, one thing is certain, and it is that the introduction of railways will cause an enormous development of the export trade of the country and a corresponding increase in imports, and that the American manufacturer should be able to take his fair share in this development, provided equality of treatment in the matter of taxation and railway rates is assured.

Manchuria was visited by war in 1894-95, and in 1899 pestilence in the shape of bubonic plague claimed a considerable number of victims. The first case that came to the knowledge of the medical practitioner at Newchwang occurred early in July in a village just outside the walls of the town. It was impossible to trace with any degree of accuracy the history of the case; but everything seemed to point to its importation by shipping from Swatow or Hong-Kong, which were infected at the time, and between which and Newchwang there is constant communication. It soon became certain that the

EVENTS IN MANCHURIA

disease had assumed an epidemic form; but it took some two months to induce the Chinese Government to recognise the gravity of the situation and the serious injury to trade and revenue which inaction was causing. At last they subscribed a sum of Haikwan taels 10,000, to enable measures to be taken to stamp out the disease and cleanse the town. This sum was more than covered by the Chinese Eastern Railway Company for the protection of the Chinese coolies engaged on railway construction, and was followed later by a much larger subscription by the same company. The foreign community of the port also subscribed most liberally, and the whole of the contributions were placed in the hands of an International Sanitary Board, of which the writer was appointed chairman. By this time, however, some two thousand victims, mostly young men, had succumbed to the disease, which was beginning to show signs of abatement. On taking office the Sanitary Board at once secured by telegraph the services of fifteen Japanese doctors and a Japanese sanitary engineer, prepared plague and observation hospitals, purchased a plague cemetery, as well as a separate cemetery for the poor, divided the town into wards, which were daily visited by the medical staff in search of cases, established dispensaries and offices in each ward, where application could be made for assistance and medicines free of charge, not only in plague but in all cases of sickness or disease, buried all exposed coffins and bodies in and in the immediate neighbourhood

MANCHURIA

of the town, disinfected houses as far as possible, handed over the streets and drains to a large staff of workmen under the superintendence of the sanitary engineer, and took every other possible measure to stamp out the dreaded pest. Three Russian doctors also took part in the work as volunteers. It was expressly stipulated by the Chinese Government that no compulsory measures should be taken; but Chinese notices were printed and posted in thousands throughout the town, warning the inhabitants of the gravity of the disease, and advising them to submit, for their own benefit, to the operations of the Sanitary Board, and Chinese booklets in the same sense were distributed by the medical staff during their house-to-house visitations. I have said that before the Sanitary Board assumed office the plague had shown signs of abatement, and only eight or nine cases, latterly of the pneumonic form, were actually treated by the medical staff, the last case occurring on the 9th of December. As the abatement of the disease seemed to coincide with the advent of cool weather, the medical staff were directed, at my request, to carry out a series of experiments on the effect of low temperatures upon plague bacilli, which had been procured from the cases treated. As the winter temperature of Newchwang falls generally below zero Fahr. every year, it seemed to be essential that these experiments should be carried out as a guide to the Sanitary Board in the steps to be taken to prevent a recrudescence of the disease. The following results, although obtained

EVENTS IN MANCHURIA

from experiments made with the plague bacillus in an *artificial* state of existence, may add something to the life-history of this interesting vegetable parasite:

1. The bacillus in a dry state promptly dies.
2. In a semi-dry state it is destroyed (in the incubator) at a temperature of 54° Fahr. in from fourteen to eighteen hours.
3. In prepared nutrient medium (bouillon and agar-agar) it will grow and multiply in a temperature of from 45° to 65° Fahr.
4. The most suitable temperature for its growth and development is the temperature of the human body.
5. Whether in prepared nutrient medium or in a semi-dry state it is not destroyed by exposure to the atmosphere at a temperature of - 12° Fahr.
6. In prepared nutrient medium it is destroyed in from seven to eight hours by exposure to sunshine at a temperature of 44° Fahr.
7. In a semi-dry state it is destroyed in from six to seven hours by exposure to sunshine at a temperature of 44° Fahr.
8. In distilled water at a temperature of 34° Fahr. it grows slowly, and continues to multiply even after fourteen days; but, owing to insufficient nutrient matter, it undergoes very remarkable involutions — a sign of diminishing virulence.
9. After multiplication the parent bacillus dies in from seven to eight days.

MANCHURIA

The disease spread for about forty miles to the north and south of the port; but it never obtained a footing in the far interior. Newchwang stretches for about three miles along the alluvial bank of the Liao, with a width of from a half to three-quarters of a mile a few feet above high-water mark, and the filthy condition of its streets held out every inducement to the plague to stay; but from November to April it is blessed with a dry, cold temperature and abundance of sunshine, which may have disastrously affected the bacillus in its natural condition in the soil, and greatly assisted the efforts of the Sanitary Board to give it its quietus. At any rate, the plague was stayed early in December, and there had been no recrudescence when I left Newchwang in the middle of April, 1900; nor have I heard of any fresh outbreak since that time. With the exception of several Russians, who are supposed to have contracted the disease while travelling, and three or four of whom died in hospital at the Russian railway settlement above Newchwang, none of the foreign community of the port was attacked.

But Manchuria was destined to be the scene of horror and bloodshed worse than any wars or plague that had gone before.

The Russians never ceased to cast longing eyes at Manchuria, and the Japanese have been firm in their determination that they shall not dominate it.

In the early years of the twentieth century the rumours that Russia had secretly agreed with China to incorporate Manchuria had some semblance of truth

EVENTS IN MANCHURIA

given them by the utterance of the Russian Minister of Finance, who spoke of the great Siberian Railroad as "Our enterprise in Manchuria." The situation grew more and more acute until in February, 1904, Japan broke off diplomatic relations with Russia, who had been actually encroaching upon both Korea and Manchuria. But Russia was utterly unprepared for war either on land or sea; her forces were widely scattered and far from the scene of Japan's first attack, which was made by way of Manchuria and Korea. Manchuria was the scene of the bloodiest battles of the war, which was, however, brought to a speedy conclusion, but with enormous loss of life and money on both sides.

The part that the United States played in the final negotiations with the contending powers will always remain one of the brightest episodes in her history. The integrity of Manchuria and Korea, — one of the main objects of Japan in the struggle — was maintained and a great step in the movement towards the complete opening up of the Orient to the World's Commerce was achieved.

CHAPTER IV

AGRICULTURE AND AGRICULTURAL PRODUCTS

PRIOR to the establishment of the present dynasty in China the inhabitants of Manchuria were, as stated in the last chapter, warriors, fishermen, and hunters, who devoted but little attention to the cultivation of the soil. They were content to produce enough to supply their own immediate wants, and to graze their flocks and herds on the succulent grasses of the steppes. More especially was this the case in the two northern provinces, for during the Ming dynasty (1368-1643) the greater part of the southern province of Fêng-t'ien was already under Chinese jurisdiction, and, under the name of Liao-chou-wei, constituted a Chinese possession, which was marked off from the Tartar tribes to the north and east by a palisade, whose position to the north of K'ai-yüan and east of Hsing-king and Fêng-huang-ch'êng may still be found traced on modern maps, although it has now all but disappeared. In the seventeenth century, therefore, Southern Manchuria was on the same footing, in regard to cultivation, as China Proper, and since the accession of the Manchu dynasty Chinese colonists have pushed

AGRICULTURAL PRODUCTS

northwards and settled on the fine rich loam, so admirably suited to purposes of tillage, where they have been amply rewarded for their enterprise and labour. Emigration to the far north has been systematically discouraged by the Government, for fear, it is supposed, of trouble with the Colossus of the North, and much of the east of Kirin and Fêng-t'ien was reserved as an Imperial hunting ground; but of late these restrictions and reservations have been relaxed, with the result that even Hei-lung-chiang is gradually reclaimed, while the Imperial hunting ground is, by permission of the Throne, fast becoming a busy centre of agricultural life.

Probably not more than one-fifth of the whole arable land of Manchuria is under cultivation. Only small patches, comparatively speaking, of Hei-lung-chiang, which exceeds in area the other two provinces combined, are annually under crop; at least one-half of Kirin yet remains untilled; and Fêng-t'ien has three or four-tenths still awaiting development. The present colonists are of themselves unable to cope with the land they have taken up, and labour is yearly imported from the northern provinces of China, especially Shan-tung and Chihli, to till, sow, and reap. From Chefoo alone more than twenty thousand Chinese labourers come to Newchwang every spring by steamer and distribute themselves all over Manchuria and Eastern Mongolia; and that number represents but a part of the annual influx, for many cross over in junks from Chefoo to ports in the south of the Liao-tung Peninsula, which are

MANCHURIA

not closed by ice in winter, and make their way overland to the scenes of their labour before the Liao River is open to navigation in the spring. These labourers return by steamer to Chefoo after the crops have been harvested, and as the return passengers by steamer exceed the arrivals by about eight thousand, it may be roughly calculated that Shan-tung annually supplies Manchuria with agricultural labour to the extent of thirty thousand men. That province also sends every year petty traders and others to the number of some five thousand men, who come to Newchwang by steamer just before the closing of the river and stay over winter in Manchuria. The province of Chihli likewise sends a large number of agricultural labourers; but as they enter and leave Manchuria by land there is no means at hand of gauging its extent. It will be seen from the above, therefore, that Manchuria is greatly deficient in labour, and that the cultivation now carried on is largely dependent on help from Northern China.

The climatic conditions of Manchuria are such as to confine agricultural operations to seven months of the year. With the exception of the very south of the Liao-tung Peninsula, where a little winter wheat is grown, the farmer does not touch his land till the frost begins to relax its grasp of the soil towards the middle of March, and he must take care that crops of all kinds are harvested before the end of October or early in November, for in the latter month the icy hand of winter again tightens

AGRICULTURAL PRODUCTS

its hold of the ground. As a matter of fact, the surface is still slightly frozen in March, when the land is broken up and drilled by plough for the reception of wheat and barley, which are ripe and harvested in June, thereby admitting of another but different crop being taken from the same soil. But the most important cereal grown in Manchuria is the tall millet (Kao-liang), or *Holcus sorghum*, *L.* It is the staple food of the population and the principal grain feed of the numerous animals engaged in the farm-work and in the immense carrying trade of the three provinces. When a field has been ploughed into drills in April, and their tops cut open by an iron coulter attached to the forepart of the plough, the seed is sown by hand in the hollows thus made, and covered with manure from baskets carried by a labourer following in the wake of the sower, and a stone roller is then passed over the drills. When the shoots are two or three inches high they are thinned by hoe — a space about a foot and a half being left between the plants — and the drills are carefully weeded and earthed up three times, after which no further labour is necessary until harvest time in September. In May, when the stems are two to three feet high, heavy rains are much dreaded, for if water stands for any length of time between the drills the roots lose their hold of the soil and rot, and the stems, especially if the rain is accompanied by wind, fall over and die. Towards harvest time, again, too much rain or too long drought is feared, for, in either case, the lower part of the grain head

MANCHURIA

fails to ripen and only a partial crop is garnered. In September the stems have attained a height of from eight to ten feet, and the heads have assumed that brown purple tint which is derived from the small dark purple cases containing the grains. Towards the end of the month the stems are cut down near the root, made into bundles and carted to the farmhouse, where a threshing floor has been prepared in the open. The heads are cut off, spread on the floor, and threshed by means of a stone roller to which an ox, donkey, or mule is harnessed. The separation of the grains from their purple cases is completed in about four hours. The empty heads are then removed, either to be burned as firewood or to be made into brooms, and the grain is swept up and passed through a winnowing machine or tossed up in the air, where the wind catches and removes the dust. The grain is now ready to be packed in sacks for market, but it has still to be husked before it can be used for human food. It is given to animals in its unhusked state. To remove the husks the grain is spread on a circular stone platform, whereon a stone roller fitted thereto crushes the husks as it revolves. The whole is then passed through a winnowing machine, which separates the grain from the husks. To cook the grains for food, they are first washed in cold water and then poured into a pot of boiling water, in the proportion of four parts water to one part of millet, and boiled for an hour. At the end of that time it will be found that the grains are pulpy and swollen

AGRICULTURAL PRODUCTS

to three or four times their original size. The soft mass is then scooped into bowls and eaten with boiled, fresh, or pickled vegetables, with the aid of chopsticks, just like rice. No salt or other seasoning is added to the millet while being boiled, and the taste is very insipid. An ordinary servant consumes 2 lb. of millet per day, while a hard-working man will, it is alleged, consume double that quantity. It is found that a change of diet is occasionally required, and native flour, which is coarser and goes a much longer way than foreign flour, is from time to time taken as a substitute for millet. A Chinese friend of mine has five servants, and he supplies them monthly with 240 lb. of millet, 16 lb. of native flour — sufficient for two days — and on two days of the month with meat. The dates on which flour and meat are given are fixed, and the intervals between them are as near as possible equal. But the grains are not the only useful part of the tall millet; the stalks play a very important rôle in Manchuria. The outer leaf layers are woven into mats, which are so much required in the trade of the country for enclosing ricks and packing loads of grain and beans, and for numerous other purposes. The stalks are also utilised for fencing, bridging, and house-building; and where wood and coal are unobtainable or dear they are used for fuel. In spring, too, the roots are ploughed up and collected for fuel. Two other kinds of millet are grown in Manchuria — *Setaria italica*, *Kth.* (Hsiao-mi), and *Panicum miliaceum*, *L.* (Huang-mi). They occupy the ground

MANCHURIA

from the beginning of April — a fortnight earlier than the tall millet — to the middle of September. Like all other cereals they are cultivated in drills, but the seed is sown much more thickly than in the case of *kao-liang*. The former, or spiked millet, requires 41 to 42 lb. of seed per acre (6.6 *mou*), which in good years will yield 18 to 19 cwt.; the latter, with 40 lb. of seed, yields only 10 to 11 cwt., and is dearer than the former, costing 5 tiaos (roughly speaking, 10 tiaos = 1 Chinese ounce of silver) per bushel of 50 lb., against 4 tiaos per bushel of about 52 lb. The tall millet on the other hand, costs between 3 and 4 tiaos per bushel of some 40 lb. These two millets are harvested, threshed, and husked like *kao-liang*, but the grain heads are not removed from the straw. In cooking the grains of spiked millet for food, water is added in the proportion of three to one, for their absorptive power is not so great as that of tall millet, nor do they require so much boiling; a quarter of an hour is sufficient. While half a Chinese pint (*shêng*), equal to 2 lb., of the latter suffices for one individual having two meals a day, the same measure of the former, but equal to 2½ lb., will cook three meals. Spiked millet, however, does not take the place of the staple food; it is used as a change of diet only. And so with *Panicum miliaceum*: the grains are ground into flour and made into cakes, in which Chinese dates or jujubes (*Zizyphus vulgaris*, *Lamb.*) are studded, or into a kind of confectionery with brown sugar. The most casual observer will not fail to notice little pyramid-shaped

AGRICULTURAL PRODUCTS

leaf packets spread out on the numerous street stalls during the summer months. These are the leaves of a reed (*Phragmites communis*, Trin.) extensively grown on salt, marshy ground, and they are used to wrap up this sweetmeat. Two varieties of the spiked millet are grown in Manchuria, with yellow and white grains respectively. I noticed the latter at a hamlet called La-yao-tzū while travelling in the province of Kirin, and was told that it is grown principally in the north; but the yellow variety is more commonly cultivated. The chopped-up straw of these two millets is universally used for fodder in Manchuria; and the proportion which their combined cultivation bears to tall millet (Kao-liang) is estimated at 30 per cent. I should have mentioned that on large farms spiked millet is sown through a metal seed tube held in the hand or attached to the end of the plough.

Manchuria is an ideal wheat field, and both barley and wheat are grown in considerable quantities. They are sown in drills in March and harvested in June, wheat ripening ten days earlier than barley. Wheat especially is cultivated on both banks of the Sungari, within the Hei-lung-chiang and Kirin provinces, and is exported in junks to the Russian province of the Primorsk. Manchuria supplies itself with native flour, and the manufacture yields bran for beasts of burden. Barley is husked, ground, and made into cakes for the most part. It is also used in large quantities ground up with peas or beans as a ferment in the distillation of native

MANCHURIA

spirit (Shao chiu) from tall millet (Kao-liang). Some 20 lb. of barley are required to sow an acre, which will yield from 14 to 25 cwt., according to the quality and condition of the soil. An acre of wheat, on the other hand, requires 17 to 22 lb. of seed, and yields 10 to 14 cwt. of grain. Wheat costs about three times as much as barley, and can be bought in good seasons from the farmer at about 3 tiaos (50 Mexican dollar cents) per bushel of 41 to 42 lb. The best native flour manufactured from wheat grown in Manchuria costs at the port of Newchwang 25 copper cash a pound, that is to say, 40 lb. can be purchased for a Mexican dollar of the value of about 50 cents.

It is difficult to disassociate the cultivation of rice from a constant and abundant water supply; but in Manchuria rice is grown on dry land like other cereals, and, unlike them, the crop is not ruined by a superabundance of rain. It is sown in drills in the end of March or beginning of April, and is ripe in September. The yield ranges from 50 to 140 fold, according to the quality of the soil. Unhusked, it costs 6 tiaos (about one Mexican dollar) per Chinese bushel, weighing 50 to 51 lb. Water-grown rice from the south of China costs about the same price laid down at the port of Newchwang; but dry-grown rice is much softer than, and its absorptive capacity is about one-half of, water-grown rice. As, however, it is twice the price of tall millet—the staple food of the people—it is not extensively grown in Manchuria. The cultivation of this dry-grown rice

AGRICULTURAL PRODUCTS

deserves the attention of countries like India, where a failure or deficiency of the rainfall means famine or dearth.

Maize, or Indian corn (*Zea mais, L.*), is grown in Manchuria in the same way as tall millet. Seventeen pounds of seed are required to sow an acre, which will yield 8 to 10 cwt. of grain. In some parts of the Liao-tung Peninsula it enters largely into the food of the people, taking, in fact, the place of millet. The grains are separated from the cob by stone rollers, and coarse ground by millstone — the yellow epidermis being removed — till each grain is divided up into three or four pieces. In this form it is boiled for about a quarter of an hour and eaten like rice. It is also ground into flour and made into cakes. The market price of a Chinese bushel (about 40 to 41 lb.) of grains is about 50 Mexican dollar cents, or 25 cents. The roots, stalks, and empty cobs are used for fuel, and one not unfrequently notices empty cobs utilised as corks or stoppers for narrow-necked wine jars. Maize occupies the ground from April to June only, and, like barley and wheat, admits of an autumn crop being taken from the same soil.

Buckwheat (*Polygonum fagopyrum, L.*) is an autumn crop which requires only two and a half months to ripen, being sown in July and harvested in September. The seed is sown in drills, and the plants are picked out about six inches apart. The average yield per acre is about 9 cwt.; but in the very cold north of Manchuria and Eastern

MANCHURIA

Mongolia, where it is chiefly cultivated, as much as 14 cwt. are said to be harvested. A bushel of about 40 lb. weight costs a little over half a Mexican dollar, or a third of a Chinese ounce of silver. It is ground into flour, which is made into a kind of macaroni, baked into cakes, or boiled to the consistency of gruel. It is very often sown after the opium poppy, of which I shall speak hereafter, and, in case of a failure of the millet crop, due to excessive rainfall or drought, it usually takes its place, so that one harvest may be secured from the soil.

The above are the eight cereals grown in Manchuria, and, where farming is carried on on a small scale, tall millet is sown for two or three years on the same soil. After several years, however, it is found that the grain decreases in quality, and a change of crop becomes necessary. On large farms, on the other hand, a certain rotation, such as the following, is adopted:

1st year	Millet.
2nd year	Beans.
3rd year	Rice, barley, or wheat.
4th year	Millet.

There is another corn plant cultivated in Manchuria, namely, *Coix lachryma, L.*, which derives its name of Job's Tears from the tear-like shape of its seed capsules. These are about twice the size of a pea, hard, glossy, and of a mottled white and dark slate colour. Strung together, they are in much demand for bracelets, necklaces, and rosaries.

AGRICULTURAL PRODUCTS

It is cultivated like Indian corn, and each capsule contains one seed or kernel covered with a thin yellow or reddish integument. The removal of the integument reveals a white grain (I-mi) with a groove along one side extending to the centre, which imparts to it a resemblance to barley. In fact, it appears in the export list of the Imperial Maritime Customs as "Pearl Barley"! The seeds are hard and brittle like rice. In the Chinese pharmacopœia diuretic and cathartic properties are attributed to them, and, although they are employed in making sweetmeats, their chief use is medicinal. As "Pearl Barley," Job's Tears are quoted in the Customs Returns at about two and a half Haikwan taels a picul of 133½ lb., whereas the market value is about three times that amount.

Next in importance to tall millet (Kao-liang) as an article of cultivation, and of still greater importance as an article of external trade, is pulse. A large variety of beans is grown in Manchuria, and, together with their resultants, bean-cake and bean-oil, they constitute by far the most valuable item in the export trade of the three provinces. In the month of April they are sown by hand in drills, and the crop is ripe in September; but as regards the beans of commerce there is an exception, namely, the small, green bean known as Lü-tou (*Phaseolus Mungo*, L.), which ripens as early as July, and which can be sown again in that month and gathered early in October. I shall have much to say hereafter in regard to this insignificant looking bean, which is

MANCHURIA

the subject of a considerable industry throughout Manchuria and Northern China. The Chinese distinguish the beans of commerce by their colours, and they are known as Yellow (Huang Tou), Green (Ch'ing Tou), Black (Hei, or Wu Tou), White (Pai Tou), Red (Hung Tou), and Small Green (Lü Tou). The yellow, green, and black are varieties of the soy bean (*Glycine hispida*, *Manch.*, or *Dolichos soja*, *L.*), and the yield per acre, which requires from 16 to 18 lb. of seed, is estimated at from 27 to 39 bushels, with a weight of about 40 lb. per bushel. Each pod contains usually two, but sometimes three beans, and four are rare. Each variety of the soy bean has a number of sub-species. The yellow has three, known respectively as (a) Pai-mei (white eyebrow), from the white scar on the saddle or point of attachment to the pod; (b) Chin-huding, or Chin-yüan (golden yellow, or golden round), from the golden colour and more rounded shape of the bean; and (c) Hei-chi (black belly), from the dark brown scar on the saddle. All the three sub-species are highly prized for the quantity of oil or fat which they contain, but sub-species (a) and (b) are noted for the quality of the bean-curd (Tou-fu) or legumin obtained from them, as well as for the sprouts which are procured by soaking the beans in water, and which are greatly relished as a vegetable.

There are two sub-species of the green bean (Ch'ing-Tou):

(a) When the epidermis is green and the inside yellow. This sub-species is said to yield more legu-

AGRICULTURAL PRODUCTS

min in the manufacture of bean-curd than sub-species (a) and (b) of the yellow bean, but the quality is inferior. It is also boiled and used as food.

(b) When both epidermis and inside are green these two sub-species yield oil or fat, but not, it is alleged, so abundantly as the yellow bean (Huang Tou).

The black bean (Wu Tou) has three sub-species:

(a) Ta-wu-tou (large black bean), of which the epidermis is black and the inside green. It yields oil or fat, and it is likewise boiled with millet or rice and used for food.

(b) The Hsiao-wu-tou (small black bean) has a bean somewhat smaller than the sub-species (a), with a black epidermis and yellow inside. It is largely used for horse feed and also yields oil, the refuse being employed for feeding pigs. It is likewise pickled for food.

(c) Pien-wu-tou (flat black bean) has an epidermis black and the inside yellow. It is flattened and elliptical in shape, and is mostly used for pickling and for horse feed.

These three varieties of the soy bean are distinguished by their ovoid shape, and differ from the ray-fruited dwarf bean (*Phaseolus radiatus*, L.), which is much smaller, glossy, and ellipsoidal with blunted ends; they include the white and red beans mentioned above, as well as several other sub-species classed according to their colour, as variegated (Hua), black (Wu), light red (Chih), etc. All the sub-species are white inside and very brittle,

MANCHURIA

showing that they contain very little oil or fat. They are used solely for food.

The Tou-fu, or bean-curd, above referred to, is a product of universal consumption in China. The beans — yellow or green — are steeped over night in cold or, if time is an object, in warm water. In the morning they are taken out much swollen and ground in a stone mill, water being poured in at the hole in the top of the mill-stone every few seconds to hasten the process. The whole is then collected and passed through a sieve or piece of cloth, which retains the epidermis of the beans. The filtrate is thereafter poured into a pot and brought to the boil. It is then poured into an earthenware *kang*, or jar, and half a bowl of brine (Lu shui), from sea-salt, well diluted, is added to and stirred in it to cause coagulation of the legumin. This occurs in about an hour, when it is transferred to a wooden frame some three inches deep, with wooden sides and bottom, whereon a cloth has been previously spread. The water escapes through the cloth and by a drainage opening at the end of the frame, the cloth is folded over the legumin; a lid of bamboos or reeds is placed on the top and weighted with stones to press out the moisture and shape the curd to the size of the frame. This is soon completed; the stones and lid are removed; and the cloth folded back exposes a whitish grey mass of the consistency of cream cheese. It is now ready to be cut up by knife, and is sold at from 8 to 9 copper cash (960 to 1,000 copper cash = 1 Mexican dollar = about 50

AGRICULTURAL PRODUCTS

cents) a catty of $1\frac{1}{3}$ lb. Three shêng (1 shêng = 3 catties = 4 lb.) of beans will yield 50 catties, or $66\frac{2}{3}$ lb. of bean-curd. Besides the actual curd various analogous substances are produced, such, for example, as Tou-fu-kan-tzū (dry bean-curd cakes), where the curd is cut up and undergoes additional pressure; Tou-fu-nao (bean-curd brain), a substance of less consistency than the curd itself, obtained by putting powdered gypsum instead of brine in the filtrate after it has been brought to the boil; Tou-fu-p'i (bean-curd skin), the scum of the boiling filtrate, which is taken off and hung up to dry; Ch'ien-chang-tou-fu (bean-curd wafers or sheets), made by placing thin layers of the legumin in cloth and subjecting them to considerable pressure, and Tung-tou-fu (frozen bean-curd), where the bean-curd is cut up, frozen, and then exposed to the rays of the sun, whereby the greater part of the moisture is removed during the process of thawing.

I pass now to the Lü Tou (green bean) — *Phaseolus mungo*, L. — the smallest but one of the most important of the beans of commerce cultivated in Manchuria. The epidermis is of a dark green colour, while the inside is whitish yellow, shading to green. It is somewhat blunted at the ends and has a white scar on the saddle. In bulk it is about one-fifth of the size of a yellow bean (Hei chi), and twenty of the latter taken at random weigh as much as a hundred and five of the former. It is much harder than the soy bean; in other words, it contains little oil or fat. This bean, when soaked in water, produces

MANCHURIA

excellent sprouts, but it is mainly and universally used for the manufacture of vermicelli. The process of manufacture is so novel and unique as to deserve minute description, and it is just possible that it may lead to similar, if not so primitive, industries in Western lands. The beans are first steeped for a night in jars of cold water. Next morning they will be found to have absorbed so much moisture as to be twice their original size. They are then ground up between two mill-stones, and the liquid mixture passed through fine sieves to separate the flour from the crushed skins, which are discarded. The filtrate is poured into jars of water, the flour sinks to the bottom, and all floating impurities are removed. The water is poured off, and the flour packed in fine hempen bags, which are hung up in the sun to dry. When this has been accomplished the bags are removed and the contents remain hard masses of white flour, which it requires considerable pressure of the hands to break up. When the vermicelli is about to be manufactured a little of the bean flour is placed in a wooden vessel shaped like a calabash and mixed thoroughly with cold water. A small quantity of this mixture is then transferred to a similar vessel, and boiling water is poured thereon until it is more than half full. A man armed with a rolling-pin then beats up the contents with great rapidity until they become of a thick, starchy consistency, when the sticky mass is dropped into a large earthenware jar, where another workman at once begins to knead and supply it with as much

AGRICULTURAL PRODUCTS

of the dry flour as it will absorb. This process is repeated until the jar is nearly full. Half-a-dozen men then stand round the jar and knead, beat, and struggle with the whole mass, continually supplying it with dry flour, until an enormous quantity has been absorbed and the dough no longer sticks to the hands and arms of the workmen. This seems to be the test of fitness for further manipulation. A wooden calabash-shaped vessel, perforated in the bottom with forty-eight small round holes and having an iron ring fixed on the edge opposite the handle, is then selected and filled with a piece of the dough several pounds in weight. The vessel is then hooked to a rope attached to a cross beam of the roof above a cauldron of boiling water, and a man, holding the handle of the vessel in his left, beats the dough with his right hand, which escapes in strings through the holes in the bottom and falls into the boiling water, whence it is immediately drawn into a tub of cold water by another individual armed with a thin, short bamboo. When sufficient lengths of strings have been obtained the latter severs them with his teeth. The vessel is constantly being refilled with dough, and the men relieve each other at the laborious beating process. When the strings are taken from the tub of cold water they are hung over a bamboo framework to dry, and are afterwards made up into hanks and bundles for market. This vermicelli has a beautiful whitish watery colour resembling to a great extent isinglass, from which, however, it differs in that it is impossible to melt it

MANCHURIA

by boiling. It enters largely into the native diet throughout the whole of China, and will be found in every land in which Chinese have settled. To the foreign palate it is somewhat insipid and tasteless, but it should not be difficult to add to a similarly manufactured article any desired flavouring.

Besides these beans of commerce there are several varieties of garden beans cultivated for food, such as the Yün Tou, of which there are two sub-species, white and red; the Chiang Tou, with several sub-species, pea-yellow and mixed, dull red and yellow predominating; the Mao Tou, or hairy bean, with short hairy pods, each containing one to three beans (epidermis white and inside green); and the Pien Tou, so called from its short but broad flat pod, which also contains one to three beans. The last named is the *Dolichos lablab*, L. With the exception of the Mao Tou these are usually cooked and eaten with the pods. The common pea (*Pisum sativum*, L.) is also grown in Manchuria, especially in the Liao-tung Peninsula. As stated above, it is ground up with barley and used as a ferment in the manufacture of spirit (Shao Chiu).

In 1893 I had occasion to contribute to the Foreign Office a report on the island of Formosa (*China, Commercial*, No. XI., of 1893), wherein, dealing with the textile plants grown there, I said: "Three of the most valuable textile plants cultivated in China are not grown in Formosa. They are *Gossypium herbaceum*, L., or the cotton plant, *Cannabis sativa*, L., or the true hemp plant, and *Abutilon*

AGRICULTURAL PRODUCTS

avicennæ, *Gærtn.*, a plant which yields Abutilon hemp." These are the only three plants cultivated in Manchuria for their fibres. Cotton, however, is not grown to any considerable extent except in the Southern province, and even there it is not of much account as a crop; but true hemp and Abutilon hemp are widely cultivated in all the three provinces, and especially in the north, where the plants of the latter attain a great height, and yield, by retting, fibre ribbons as long as fifteen feet. The average length, however, is from seven to ten feet. The fibre of true hemp, which is less cultivated than Abutilon hemp, is shorter but more expensive, costing \$100 to \$125 a ton, against \$55 to \$65 for the latter. The fibre of Abutilon hemp is much whiter than that of true hemp, but its tenacity is not nearly so great. The seed of both these hems is sown in April in drills — intervals of four to five inches being left between the plants — and the crops are harvested in August. Sacking and coarse cloth are manufactured from true hemp, and both fibres are extensively used for making rope and cordage, large quantities of which as well as of sacking are required for the enormous cart traffic of the interior. The large leaves of the Abutilon plant are greatly used for the adulteration of tobacco. I have already mentioned that mats of various kinds are made from the outer sheathing of the millet (*Holcus sorghum*, *L.*) stalks, but still more important are the stems of the reed called *Phragmites communis*, *Trin.*, which grows wild in many parts

MANCHURIA

of Southern Manchuria. They are cut up into different finenesses, according to the quality of the mats to be manufactured. They are also woven whole into very large mats for covering the rafters of houses before the tiles are put on. The great centre for the manufacture of these reed mats is the district of Kai-p'ing, to the south and east of the port of Newchwang.

The plants grown in Manchuria whose seeds yield oil are six in number. They are (1) *Dolichos soja*, L., or soy bean above referred to; (2) *Ricinus communis*, L., or castor-oil plant; (3) *Sesamum orientale*, L.; (4) *Perilla ocymoides*, L.; (5) *Gossypium herbaceum*, L., or the cotton plant, and (6) *Cannabis sativa*, L., or the true hemp plant. The names and uses of the oils are the following: (1) *Tou yu* — cooking, mixing paints and lighting; (2) *Ta ma* (or *Pi ma*) *yu* — lubricating and candle making; (3) *Hsiang yu* — cooking; (4) *Su yu* — boiled and used in place of linseed oil; (5) *Hua tzü* (or *Hei*) *yu* — lighting, softening leather and harness, and as hair oil; and (6) *Ma tzü yu* — mixing paints. All these seeds, with the exception of *sesamum* seeds, which are roasted, are crushed, steamed, and subjected to great pressure, and the following table gives approximately the percentage and value of the oil extracted:

AGRICULTURAL PRODUCTS

Oil-yielding Seeds.	Quantity		Value.		Oil.		Refuse Cakes.	
	Catties.	Taels.	Catties.	Taels.	Catties.	Taels per 100 Catties.	Catties.	Taels per 100 Catties.
Beans	100	1.67	9	6.70	97.5	1.10		
Perilla Seed	25-26	0.40	9	6.50	20	0.65		
Hemp Seed	30	0.29	6.5	5.60	24	0.5		
Castor Seed	25	0.32	12	5.80	15	0.8		
Sesamum Seed	29	1.30	13	10.00	15	0.65		
Cotton Seed	100	0.64	10	{ 4.00 3.40 }	?	{ 1.20 0.60 }		

The ground nut (*Arachis hypogæa, L.*) is cultivated in Manchuria for food, not, however, to any great extent, and oil is not extracted from the nuts as in the south of China.

So far as I can gather, the only dye-plant grown in Manchuria is the Dyer's Knot weed (*Polygonum tinctorium, L.*). True indigo from *Indigofera tinctoria, L.*, is not a product of these provinces; but the *polygonum* yields a similar blue dye, which is universally employed in the many large dyeing establishments of Manchuria, where it is called Lan-tien. The seeds are sown in April, in drills about nine inches to a foot apart, and in the latter half of September, and, before blossoming, the plants are cut down near the roots, steeped tips downwards in lime-lined vats containing water, and weighted with stones. The steeping lasts thirty-six hours. The plants are then removed, and the water in which they were steeped — now green in colour — is poured into large earthenware jars, standing on a concrete floor, having a conduit leading to a large tank sunk in the ground. Into

MANCHURIA

another similar jar, also containing green water from the vat, a piece of lime is placed, and a part of the stirred-up mixture, weighing about three pounds and of the consistency of cream, all undissolved lime and impurities being avoided, is poured into each of the other jars. A man then proceeds to beat the contents of each jar with a square piece of wood, in the centre of which a long wooden handle is fixed. Gradually the green water assumes a dark blue colour, and it is calculated that when five hundred blows have been struck the *grain* has been completely separated. The jar is then emptied into the conduit, by which the contents find their way to the tank. Here the blue granules sink to the bottom, and, when the surface water is removed, the sediment is collected and made up into cakes for market as dry indigo, or poured into waterproof papered baskets and sold under the name of liquid indigo.

The opium poppy (*Papaver somniferum*, L.) is cultivated throughout the whole of Manchuria; but the great centre of production and export lies to the north of the Sungari, in the south of the province of Hei-lung-chiang, and the chief market for the drug is the city of K'uan-ch'êng-tzŭ or Ch'ang-ch'un Fu in the province of Kirin. The reason given for the more extensive cultivation in the north is that the expense of carrying cereals and pulse to a market in the south is too great, whereas opium, being less bulky and more valuable, admits of easy transport, and can be at once exchanged for ready money. There is a great demand for this opium

AGRICULTURAL PRODUCTS

in Northern China, and agents visit Manchuria annually and carry back the drug overland in small fast carts during the winter months, avoiding the main roads and the tax stations established along them. It is also extensively smuggled, being readily concealed among the produce brought down in large carts. The poppy occupies the ground from March to July, when the capsules are ripe for bleeding. Curiously enough, the scarifying is done horizontally, not vertically, as in Western and Central China, and, it is alleged, very imperfectly, the sap being collected as soon as it exudes and not allowed to stand over till next morning, as is the custom throughout India and in the great producing centres of Western China. It is impossible to arrive at even an approximate estimate of the quantity produced in, and exported from, Manchuria, for none, or at least very little of it, passes through the Foreign Customs; but one thing is certain, sufficient is grown to supply all local wants and to admit of a considerable export overland and by junk. Moreover, taxation being light, it is about half the price of Indian opium, the import of which is yearly declining. It is stated in favour of the native article that the ashes can be resmoked much oftener than those of the Indian opium. Many of the labourers returning to Chefoo before the closing of the port in winter invest their savings in native opium and smuggle it across to Shantung. Seizures are frequently made on board steamer by the Custom House authorities at Newchwang.

MANCHURIA

The variety of the tobacco plant grown in Manchuria is *Nicotiana rustica*, L., introduced from Manila through Japan and Korea. It is widely cultivated in all the three provinces; but the product of Kirin is said to possess the best flavour, and it realises the highest price. The seed is sown in May, and the harvest takes place in October. In the far north the crop runs a great risk of being destroyed by early frosts. The plants are cut down near the root and hung up to dry in the sun, after which the leaves are slowly pressed and assorted. In matter of bulk tobacco ranks next to beans and hemp in the trade of the interior, and it is carried overland and by junk to the Northern provinces of China in very large quantities. The product of Manchuria is not appreciated in the south of China, and little is exported by steamer. As stated above, it is adulterated with the fine big leaves of the Abutilon hemp plant.

The most important and most valuable of all the medicinal plants grown in Manchuria is ginseng (*Panax ginseng*, C. A. Meyer). Whether the root actually possesses any therapeutic properties is a disputed point; but the Chinese have implicit confidence in its virtues, and so long as that exists the demand for it will continue. As in Korea, it is indigenous to the country, and it is found in a wild state in the forests of Kirin, especially in the Ch'ang-pai Shan range, where ginseng seekers annually scour the mountains in search of it. When a wild plant is found its age is carefully noted by observing the

AGRICULTURAL PRODUCTS

quantity of its foliage. I am told that a plant of one year's growth has only one three-fingered leaf on a short stem; in the second year two similar leaves; in the third year the leaves are four-fingered, and so on until in the fifth year it has a longish stalk with several petioles each with five-fingered leaves. After this it blossoms and fruits, throwing up a continuation of its stalk, crowned with an umbel, from the junction of the petioles. In the seventh year the root is sufficiently matured to be dug up and prepared for market. In Japan, on the other hand, it matures much more rapidly, being ripe in the third or fourth year. If, then, the plant, which has been discovered in a wild state, has already reached, or is approaching, maturity, it is either dug up or its position carefully marked until it has fully matured. If, however, it is still young, it is usually dug up and transplanted near the spot where it has been found (the transplanting causing it to grow more rapidly), or in a place where it will be under the eye and care of the cultivator. This transplanting distinguishes the first from the second quality of the drug. The root which matures in an entirely wild state is the more valuable. But nearly all the ginseng exported from Manchuria is grown from seed which is sown in narrow beds in the valleys among the mountains, and this constitutes the third quality. In growing from seed the plants are invariably transplanted when they are a year old. After the matured roots are dug up they are thoroughly washed in cold water, and every particle of

MANCHURIA

earth removed by a soft brush, great care being taken that the epidermis is not bruised or injured. They are then of a yellowish white colour; but in their natural fresh state they would soon rot, so that steps have to be taken to preserve them. An ordinary rice bowl is filled half full of clean sugar (white or brown, according to the colour to be imparted to the roots), and boiling water is poured thereon. When cool the mixture is of a treacly consistency, and it is then used for coating the roots, being applied by means of a soft brush. When coated the roots are laid on a piece of clean cloth, spread on the top of a grating over a pot of boiling water, a wooden lid or cap being placed over all. The steam ascending through the cloth softens the roots, which absorb part of the sugar, the remainder finding its way through the cloth into the boiling water, where it ultimately sinks to the bottom of the pot and recrystallises. This sugar, not unlike toffee, has acquired a slight flavour of ginseng, and is sold as "ginseng sugar" at about a dollar a catty. During the steaming of the ginseng roots the coating of sugar is frequently applied, until they are sufficiently sweetened. They are then removed from the steamer and spread on trays to dry in a not too powerful sun. When dry this ginseng, now less than one-third of its original weight, is very much softer than Korean ginseng, which is nearly as hard as stone and very brittle. In Japan, ginseng, although also sun-dried, is usually baked for two or three days in kilns heated to a temperature of 210° to 250° Fahr., and probably some

AGRICULTURAL PRODUCTS

similar system is adopted in Korea. At any rate, I am assured that considerable quantities of Manchurian ginseng are taken to Korea for treatment, and it is not unlikely that much of the so-called Korean ginseng exported from Manchuria is really native-grown ginseng preserved in Korea. True, in former years, when Korea paid annual tribute to China, Korean ginseng was brought into Manchuria in large quantities, for the members of the Mission whose route to Peking lay through Southern Manchuria were permitted to carry, free of duty, certain fixed amounts, each according to his rank. It is laid down in No. VIII. of the rules agreed upon between China and Korea for the traffic on the frontier between Liao-tung and Korea, of March, 1883, that "if the Envoys do not carry merchandise with them, each officer will be allowed, free of duty, any quantity of clothing, private effects, books, and medicines, not exceeding three hundred catties in weight. The junior Legation officers and the suite who may be desirous of participating in the advantages arising from the carriage of goods will be allowed a quantity of red ginseng, limited in the case of Legation officers to twenty catties each, and in the case of attendants or followers to ten catties each." Nor is there reason to suppose that these defined weights were strictly adhered to.

A careful examination of the head of a ginseng root reveals a series of fine parallel horizontal wrinkles or indentations, which, if natural, stamp the root in the eyes of a ginseng connoisseur as valuable on

MANCHURIA

account of its age; but the Chinese in Manchuria are clever enough to produce artificial indentations if they do not naturally exist or are insufficient in number. During the steaming process a thread is wound round the head. The steaming causes the root to swell, with the exception of the parts bound by the thread, and when the root contracts in drying the artificial wrinkles remain.

There is, again, a recognised taste in the matter of ginseng. The Southern provinces of China, such as Kwangtung, Kwangsi, and Fuhkien, take white only, whereas the Central provinces, such as Kiangsu, Anhui, Hunan, and Hupeh, prefer the red, and to satisfy the latter taste, brown instead of white sugar is used for coating the roots while they are being steamed, thereby imparting a pale reddish tint to the epidermis. Much of the Korean ginseng is pronouncedly red; but whether this colouring is artificial, or due, as some think, to the ferruginous soil in which it is grown, I am not in a position to say. It is impossible to state even approximately the value of ginseng, for the real wild root has been known to realise a thousand times its own weight in silver, while ordinary cultivated ginseng may be purchased in the market for about two taels (say, \$1.75) a catty of one and a third pounds. The clarified ginseng exported to China from the United States is made from the root of *Panax quinquefolium*, L., a species of ginseng which grows in the Appalachian Mountains, and I cannot do better than conclude these remarks on ginseng with a little

AGRICULTURAL PRODUCTS

anecdote appropriate to the subject. A Chinese merchant was present at one of the United States Exhibitions, and was there introduced to an American gentleman, who asked him to take a glass of wine with him. In the course of conversation the merchant asked the American the nature of his business, and the latter replied that he was a large manufacturer of clarified ginseng. "Ah!" said the Chinese, "ginseng is a very valuable medicine in my country. Pray, sir, can you tell me what its specific medicinal properties are?" "Well," said the American, "perhaps as a manufacturer I ought not to say so, but, in my opinion, ginseng has no more medicinal virtues than an ordinary carrot!"

The following plants, the roots of which are also used in medicine, are grown in Manchuria: *Platycodon grandiflorum*, D.C.; *Pæonia albiflora*, Pall.; *Peucedaneum terebinthaceum*, Fisch.; *Asarum sieboldi*, Miq.; *Glycyrrhiza glabra*, L., et *palladiflora*, Maxim. (Liquorice); *Gentiana scabra*, Bunge; *Arisæma* sp.; *Astilbe chinensis*, Franch. et Sav.; *Astralagus hoantchy*, Franch.; *Ptarmica sibirica*, Lebed.; *Atractylis ovata*, Thunb.; *Aconitum kusnezofii*, Rich.; *Angelica inæqualis*, Max.; *Lithospermum erythrorhizon*, Sieb. et Zucc.; *Polygonatum officinale*, All. The bark of *Phellodendron amurense*, Rupr., and *Dictamnus albus*, L., and the leaves of *Ephedra vulgaris*, Rich., and *Clematis heracleæfolia*, D.C., are grown and exported for medicinal purposes, as also the seeds and fruits of *Plantago major*, L.; *Coix lachryma*, L.; *Cratægus pinnatifida*, Bunge; *Pinus coraiensis*, Sieb. et Zucc.;

MANCHURIA

Arctium lappa, L.; *Cuscuta chinensis*, Lam.; *Schizandra chinensis*, Baill.; *Prunus japonica*, Thunb. (kernels), and the leaves or grass of *Equisetum hiemale*, L. Curiously enough, the castor-oil plant (*Ricinus communis*, L.) which, as stated above, is cultivated for its oil, is not looked upon as medicinal.

The vegetables and fruits of Manchuria include several varieties of the potato (*Solanum tuberosum*, L.) of excellent quality, two varieties of the turnip (round red and long green), two varieties of the radish (red and white), the carrot, garlic, onion, leek, celery, brinjal or egg-plant (*Solanum melongena*, L.), taro and, most important of all, Shantung cabbage (Pai ts'ai — *Brassica campestris*, L.). The last named enters largely into the diet of the people, and is universally cultivated, not merely in gardens, but in fields. It does not, however, attain the size, nor does it possess the quality, of the cabbage grown from the same seed in the Shantung province, more especially in the Lai-chou prefecture, and the following story, perhaps slightly exaggerated, will give an idea of the proportions which it there develops. A gentleman in Chefoo received a letter from a friend in Lai-chou announcing that he was sending him a present of a cabbage. The recipient was somewhat annoyed at what he considered the insignificance of the gift, tossed the letter aside, and thought nothing more of the matter until a day or two afterwards when his servant reported to him that a cabbage had arrived, and that the carter evidently expected a *pourboire*. "Carter!" said the

AGRICULTURAL PRODUCTS

gentleman, "what do you mean? Has the cabbage come by cart?" "Yes, sir," replied the servant, "the cart is now at the gate." Determined to get to the bottom of the matter, he went to the gate, and there lay a huge cabbage about 400 lb. in weight, occupying the whole of the cart! "That cabbage," said the gentleman, "lasted me a whole winter." White hearts, each weighing 20 lb. and upwards, from Shantung are frequently to be seen in the market at Newchwang. They likewise include many forms and varieties of the *Cucurbitaceæ* melon, pumpkin, squash, vegetable marrow, cucumber, and gourd — of which the following are the native names: Hsiang Kua, Wo Kua, Tung Kua (*Benincasa cerifera*, *Savi*), Ssü Kua (*Luffa petola*, *Ser.*), Huang Kua (*Cucumis sativus*, *L.*), Hsi Kua, Yü Kua, Lai Kua, Sao Kua, Sai Kua, Hu tzü, and Hu lu (gourd — *Langenaria vulgaris*, *Ser.*). The last named is cultivated for its hard shells only, which, cut in two, make excellent water balers, just as another variety called Ta Kua is grown for its seeds, which are used for food and exported in considerable quantities under the name of "melon seeds." It is generally, although erroneously, supposed that these seeds are derived from all varieties of melons. They are, however, the produce of the Ta Kua, which is cultivated like other crops; but it is so exhausting to the soil that six years are allowed to elapse before it is grown on the same ground. Another important vegetable in Manchuria is Chieh (kai) t'sai. It develops a bulb inferior in size to a turnip, and has numerous long,

MANCHURIA

broad, finely scalloped leaves. Both bulb and leaves are salted in jars and eaten as a pickle. This is the vegetable which is exported from Ssŭ-ch'uan in such large quantities under the name of "salted turnips." Sweet basil (Hsiang ts'ai — *Ocimum basilicum*, L.) is also cultivated, and the following wild plants are also eaten: Shu-mu-ts'ai, K'u ts'ai (*Lactuca brevirostris*, Champ.), Hsien ts'ai, P'u sum (rush shoots), and the bulbs of Pai Ho, a species of *Lilium*. The seeds of the sunflower are also roasted and eaten. Three kinds of edible fungus — Huang mu, Pai mu, and Mu êrh — grow on dead wood, principally in the east of Kirin province. Foreign vegetables, such as the tomato, lettuce, cabbage, Jerusalem artichoke, celery, etc., grow well in Manchuria.

There are several varieties of *Vitis*, notably *Vitis vinifera*, L., *Vitis Labrusca*, L., *Vitis heterophylla*, Thunb., and *Vitis serianæfolia*, Maxim., and excellent grapes, round and long green and purple, are produced. The common pear of Manchuria is hard and insipid; but there is one kind, called Hsiang-shui-li, grown in the Liao-yang district, which is famed for its sweetness. It is, however, so soft that it does not readily bear transit in a fresh state. It is preserved and packed in boxes like figs. The usual varieties are *Pyrus baccata*, L., *Pyrus sinensis*, Lindl., and *Pyrus spectabilis*, Ait. Apples are poor, with the exception of the Siberian crab apple and a small red variety called Hung-tzŭ, grown in the Kai-p'ing district to the south of the port of Newchwang. Chestnuts, walnuts, peaches, plums, and

AGRICULTURAL PRODUCTS

apricots all grow well, and the kernels of the last named are exported under the name of "bitter almonds." A kind of cherry is said to be cultivated in the Liao-yang district; but it is more probably the fruit of *Prunus tomentosa*, *Thunb.* Cob-nuts, flat-topped from *Corylus heterophylla*, *Fish.*, and pointed from *Corylus rostrata*, *Ait.*, grow wild in the hills; but they are of very poor quality. Jujubes — known as "red dates" (Hung tsao) — are the fruit of *Zizyphus vulgaris*, *Lam.*, and are largely used in making sweetmeats. The fruit of the hawthorn (Shan cha — *Cratægus pinnatifida*, *Bunge*) grows to a large size, and is highly appreciated as a condiment. Strawberries, barberries, gooseberries, and currants are found wild, but they are not cultivated except in the gardens of foreign residents.

CHAPTER V

ANIMAL AND MINERAL PRODUCTS

THE most valuable of all the animal products of Manchuria is silk—raw, wild silk—the produce of *Antheræa Pernyi*, otherwise known as *Bombyx Pernyi* and *Bombyx Fantoni*, which feeds and spins on the oak called *Quercus mongolica*. The silk region, however, is confined to the province of Fêng-t'ien, and extends from the sea on the south to a little to the south and east of Mukden, its western and eastern boundaries being the Liao and Ya-lu Rivers respectively. In other words, the silk district of Manchuria is limited to that portion of the province of Fêng-t'ien in which the hill slopes face the south. A few scattered families feed the worm on mulberry leaves and obtain a little silk for private use, and others, again, reel silk from the cocoons of worms which feed on the leaves of *Ailanthus glandulosa*, *Desf.*; but the latter contain only an insignificant quantity of silk, and neither mulberry nor ailanthus-fed silk can be considered a factor in the silk production and trade of Manchuria.

Antheræa Pernyi is bivoltini, and the imago of the autumn cocoon, which is completed in the end of September or early in October, does not, owing

ANIMAL & MINERAL PRODUCTS

to the cold experienced during the winter months in Manchuria, emerge from the pupa state until the beginning of May. In that month the females lay their eggs, sometimes on sheets of paper, but usually on cloth prepared for their reception. The eggs are then exposed to the air and the worms hatched in about six days. Immediately after hatching they are placed on leaves gathered from the oak bushes springing from the roots of the oak trees, which are purposely felled at the end of five or six years, so that tenderer leaves may be obtained from the young shoots. On these leaves they feed until the first moult or "sleep," when they are transferred to the bushes themselves. They attain maturity in from fifty to sixty days from the time of hatching, and then proceed to spin their cocoons — a process which occupies about five days. When the cocoons are completed they are collected from the trees, and the leaves and silk threads joining them thereto are removed, leaving the cocoons and the envelopes of silk which surround them.

To reel the silk from the cocoons about ten and a half pints of water are poured into an ordinary Chinese iron cooking pot or open pan and brought to the boil. To this are added eight ounces of crude soda, itself a Manchurian product, and thoroughly dissolved, and when the solution is off the boil a thousand cocoons are dipped and tossed about in it for some five minutes, so that they may be impregnated with it without being filled. They are then placed in a basket, and the solution which has not

MANCHURIA

been absorbed is poured over them. Meantime another pot of water with a wooden grating just touching the surface of the water has been brought to the boil, and the basket containing the cocoons is placed on the grating. The whole is then covered with a wooden cap fitting into strands of plaited *Abutilon* hemp, to prevent the escape of the steam. Here the cocoons remain from one and a half to three hours. The fire is then drawn, and after the lapse of fifteen hours the cap is taken off and the basket of cocoons removed. A workman now takes each cocoon separately and removes by hand the outer envelope of silk, leaving only the reelable cocoon. When fifty have been thus treated they are placed on a table, and a workman at once proceeds to reel them, taking the filaments of eight, ten, or twelve cocoons, as the case may be, to form a thread. Reeling from cocoons in hot water is now out of fashion in Manchuria. The wheel on which the silk is reeled is four-sided, and so formed that the centre bar can be pushed out so as to facilitate the removal of the reeled silk, and as a rule eighty cocoons are required to make a skein. Three skeins go to a hank, so that a thousand cocoons make four hanks; but the weight of skeins and hanks varies considerably. As the filament becomes finer and thinner as it nears the centre of the cocoon, it is necessary, in order to obtain a uniform thread, to add a cocoon or two during the reeling. A peculiarity of this wild silk is that the filament, or rather the double filament — for the two spinning ducts

ANIMAL & MINERAL PRODUCTS

unite and form one tube under the mouth of the worm — is flattened, not round, as in the case of *Bombyx Mori*, with the result that when the silk is thrown, *i.e.*, twisted to form thread, it is not so even as the thread from the latter. But in the manufacture of pongees, for which this silk is locally used, the silk is not thrown. Each skein or hank is rinsed through tepid and cold water to remove the soda, and when it is half dried it is again dipped in bean-flour water, to which a little melted glue has been added, so that the filaments constituting the thread may be united for weaving purposes.

To facilitate mere reeling the treatment of the cocoons as above described is perfect; but the process is very injurious to the silk itself. In the first place, the alkali solution used to dissolve the gum in the cocoons is far too strong, and, in the second place, the pans should not be made of iron, for the alkali combines with the iron and discolours the silk, thus rendering it unsuited for dyeing any but the darker colours. For this reason only copper pans are used in the Shantung province, and hence it is that the Shantung wild silk is of a lighter colour than the Manchurian. Moreover, the high temperature to which the cocoons are exposed so long detracts from the strength and elasticity of the silk, which are declared to be greater than in the case of mulberry-fed silk. The result is that when the silk arrives in Europe it has to be unwound and carefully cleaned before it is thrown. The cocoons of the spring crop (*i.e.*, spun in July), although they contain much less

MANCHURIA

silk than the cocoons of the autumn crop (*i.e.*, September–October), are of better quality; but little of it finds its way to a foreign market. When the moths emerge from the July cocoons, towards the end of that month or beginning of August, the females, after copulation, are tied to the oak bushes by threads attached to their wings, and deposit their eggs on the leaves. After a few days the worms hatch, and at once find their own food, requiring no further attention than the warding off of birds and other enemies. It is a curious fact that the moths emerge from the cocoons without severing a single filament, for the softening of the head-ends of the cocoons by the liquid which they eject from their mouths enables them to push aside the filaments on their way out; but the cocoons themselves are so disarranged and constricted by the pressure that it is impossible to reel them in the ordinary way. These, with the envelopes surrounding the cocoons, constitute what is known as silk waste, largely employed, principally in England, for making imitation seal-skin plushes. This wild silk is known as *Tussah*, from the Chinese words *Tu Ssŭ* (local silk).

The chief centres of the silk trade in Fêng-t'ien are the cities of Hai-ch'êng, Hsiu-yen, and Kai-p'ing, and much goes by junk from the numerous ports in the south of the Liao-tung Peninsula not open to foreign trade, whence it is carried to the Shantung province for sale, as well as for manufacture into pongees.

Owing to the greater weight of *Antheræa Pernyi*

ANIMAL & MINERAL PRODUCTS

the cocoons are much heavier than those of *Bombyx Mori*, and they contain less silk, so that while four to five pounds of the latter will yield about one pound of raw silk, fourteen to sixteen pounds of the former are required to yield a like quantity. The following may be taken as the average weights of one thousand fresh live cocoons of mulberry and oak-fed worms:

Mulberry (*Bombyx Mori*) . . . Kilo. 1.870.

Oak (*Antheræa Pernyi*) . . . “ 7.071.

The silk as reeled by the native method has a dark gold or copper colour without much lustre; but when treated by the Western system I have seen it almost white and very glossy. It has been stated that a naturally black silk is produced in some parts of Fêng-t'ien, and the colour is attributed to the worm eating not only the leaves but also their ribs and veins. This, however, is in all probability due to diseased worms, and cannot be considered a natural product.

The average price per picul ($133\frac{1}{2}$ lb.) is about Haikwan taels 150 (say, \$125). In former years it has been bought for Haikwan taels 80 a picul; but latterly it has been in great demand, and the price has been as high as Haikwan taels 200. The increasing value cannot fail to stimulate production, which is capable of great development in a country where the conditions are nearly perfect.

Next in importance to silk are furs, which are derived from a variety of animals, including the bear, cat, dog, fox, goat, hare, leopard, otter, sable,

MANCHURIA

sheep, squirrel, tiger, weasel, and wolf. The mountains and forests of Manchuria, especially the Ch'ang-pai-shan and Hsing-an ranges, in the Kirin and Hei-lung-chiang provinces respectively, are tenanted by bears, leopards, sables, squirrels, and tigers, and the hunters, who dwell in huts in the mountain valleys, are nominally under the jurisdiction of an official superintendent. In the Hei-lung-chiang province, however, they are more under Government control, and have to pay through their superintendent, who resides at Tsitsihar (Pu-k'uei), tribute of animals and furs once a year to the Emperor. These animals are usually trapped, and the following description of a sable trap is from the pen of Mr. H. E. Fulford, who visited the Ch'ang-pai-shan in 1886: "The trap consists of a log of wood placed on the trunk of a fallen tree, and propped up at one end by a catch, which is released when the sable runs underneath, and the log pins him to the tree. A sort of run is made by pieces of wood driven into the tree in two parallel rows, between which the sable is obliged to run in going along the trunk. Two bits of bark are laid between these pegs, and the pressure of the animal on them makes the catch fly. Squirrels have also the habit of running along the trunks of fallen trees, and are caught by the same traps." Tigers, again, are caught in traps consisting of large wooden cages wherein pigs are usually tied up as bait. Bears are as a rule shot. The skins, which owing to the severe winter climate are frozen hard, are taken to Kirin and Mukden

ANIMAL & MINERAL PRODUCTS

to be cleaned before the thaw sets in in spring. Another great centre for cleaning furs is the city of Chin-Chou Fu, in the south-west of the Fêng-t'ien province, but the furriers of Mukden are declared to possess the greater skill, the skins prepared there being free from smell. In the Customs Returns of Newchwang for 1896 prepared sable skins are quoted at seven Haikwan taels a piece, about \$4.75; leopard skins at eight taels each, the price paid for the best tiger skins at Newchwang when that port was opened to trade in 1861, and tiger skins at thirty-five taels, nearly \$30.00. But large and well marked tiger skins fetch very high prices, \$75 being by no means uncommon. The Manchurian, however, is much finer than the Indian tiger skin.

By far the most important branch of the skin and fur trade of Manchuria consists of the skins of the domesticated animals, the dog and the goat. Many thousands of these skins are annually exported from Newchwang and Tientsin, and ultimately find their way principally to the United States, and the following interesting note on this subject is taken from the British Consular Report on the trade of Newchwang for the year 1887: "It is generally supposed that the animals, wild or tame, are picked up wherever they may be found straying, destroyed, and the skins sold to dealers, who make them up into mats, robes, etc. This idea is erroneous, careful inquiry having established the fact that the business is now conducted after the manner of sheep farming in Australia, though it probably began in a small, vagrant kind

MANCHURIA

of way. There are thousands of small dog and goat farms scattered over the northern districts of Manchuria and Mongolia, where from ten to hundreds of animals are reared yearly. When a girl is married she receives perhaps six dogs as her dowry, and it can easily be understood that this comparatively small beginning may be the foundation of a large fortune, seeing that the reproduction of ten per annum would in a few years give an enormous total. A dog matures in from six to eight months, and the fur is at its best during winter, so that the animal must be destroyed before the thaw sets in. Nature has provided a magnificent protection to withstand the cold of these northern latitudes, where the thermometer (Fahrenheit) goes down to 25° below zero, *i.e.*, 57° of frost, and it is doubtful if the dog skins in any other part of the world are to be compared with those that come from Manchuria or Mongolia, either in size, length of hair, or quality. The question of food for so many animals naturally presents itself. If they had to be kept entirely by their masters the industry could not be a paying one. The coarsest grain — millet that is not good enough for horses — mixed with the ordure and rubbish of the farm, is always ready for them when by foraging outside they are unable to satisfy the pangs of hunger. Water is always ready at the farm, which cannot be procured elsewhere during the winter; and so, without counting the well-known fidelity of the dog towards its master, there are sufficient inducements for the animal to stick to the place

ANIMAL & MINERAL PRODUCTS

where it has been bred." In another part of the same report Mr. Holland, the writer, says: "The flesh, even of the dogs, is no doubt used for human food, and the market value thereof enters largely into the farm's profit and loss account. The animals are fit, before spring sets in, whilst their coats are long and warm, to be killed, which is effected not by knife, which might injure the fur, but by strangulation. The skins dried and frozen find a market at Mukden and other places, where they are cured before the thaw affects them, priced, assorted, and made into mats and robes." The information which I have been able to collect on this subject agrees in the main with the above description, and does not, I regret to say, detract from the barbarous treatment of these dumb animals. Bear and excellent wolf skins, the latter from the Heilung-chiang province, are always in the market, but they are not in great demand as articles of export. In addition to these the land-otter supplies valuable skins, and the skins of the wild-cat and hare afford warm clothing to the poorer classes. Sheepskins, mostly from Mongolia, are to be met with everywhere in winter, and the local demand is very great. They are exported in large quantities from Tientsin, which is the chief outlet for Mongolian produce.

The great fertility of the soil of Northern Manchuria and Eastern Mongolia enables the cultivator to produce enormous crops of grain and pulse; but the distance which separates these fertile tracts from the populous centres of consumption further south

MANCHURIA

is the great barrier to the profitable disposal of food products. The long and expensive transport of grain by cart in winter — the only season in which the roads in the interior are fit for traffic — precludes successful competition, and the result is that large quantities of millet are disposed of for the manufacture of spirits at the numerous distilleries which are scattered about the centres of production. Here, however, I am concerned only with the refuse of these distilleries, which is utilised for the feeding and fattening of enormous herds of pigs. These animals, which attain huge proportions, are, so far as I have observed, uniformly black. They are either killed in winter, dressed and brought down in a frozen state by cart, or walked overland in herds to Mukden and other populous cities for sale and consumption. But it is the bristles of these pigs which concern foreign trade, and I am convinced that this branch is capable of great development. So, too, with regard to horse hair (manes and tails). Notwithstanding the hundreds of thousands of horses, mules, and donkeys engaged in the carting trade of Manchuria, only twenty tons of hair were passed through the Newchwang Custom House in 1896, against 364 tons from Tientsin. And this small quantity does not surprise me, for although I have journeyed into the centre of Manchuria I never once observed cart animals being groomed, and it may be that this hair is derived from such as have succumbed to age or to overwork. I should have mentioned above that pig's hair is mostly

ANIMAL & MINERAL PRODUCTS

utilised for manure, and it is said to be specially valuable for manuring indigo.

Felt of various kinds and qualities is largely manufactured in Manchuria, the chief centres of the industry being K'uan-ch'êng-tzŭ in Kirin and Mukden and Chin-chou Fu in Fêng-t'ien. Common or brown felt is made from ox-hair. The hair, having been first washed and dried, is sprinkled evenly by hand on a mould or screen of bamboo of the required length and width, the amount of hair depending on the desired thickness of the felt, and the screen is then rolled up tightly with the hair inside. The mould is rolled backwards under pressure by hand or foot for a couple of hours, water being added from time to time to soften the contents and hasten the attachment of the hair, when the mould is unrolled and the piece of wet felt placed in the sun to dry. This is coarse felt, mostly used for carpets and bed mats. It possesses little strength and has to be swept, when it *is* swept, very lightly, for the hair readily peels off with the least pressure. For the finer felt sheep's wool is used, and the shorter hairs which rise to the surface of the water when the wool is being washed are usually utilised for the purpose. It is strong and tough, and principally made up into caps and the uppers of winter shoes, and it can be readily dyed. Many thousands of pieces of felt are annually exported by steamer from Tientsin and Newchwang.

Excellent carpets and rugs of heavy pile and of any required shape, pattern, or colour are manufac-

MANCHURIA

tured by hand from camel and sheep's wool imported into Manchuria from Mongolia. The twine used to bind the wool together is made of common hemp. The great centre of manufacture is Chin-chou Fu, whence carpets and rugs are conveyed, for export, to Tientsin, where this industry is also carried on. There is considerable demand amongst foreigners for these manufactures, but unfortunately in damp climates they are liable to emit a disagreeable smell.

I have already referred to the trapping of the tiger for his valuable skin, but that is not the only part of the animal to which the hunter gives his attention. The bones find an honoured place in the Chinese pharmacopœia, and in the Customs Returns of Newchwang for 1896 tigers' bones, weighing 3,600 lb. and valued at 30 cents per lb., appear as an export. The deer, too, is hunted for his horns and sinews, both of which are utilised as medicines. Pits, ten to twelve feet deep, are dug in early summer in the forest tracks and carefully covered with leaves and twigs, for it is then that the horns are "in the velvet" and realise a high price. As many as 1,644 pairs of young horns were exported by steamer from Newchwang in 1896, and they were valued at Haikwan taels 45,600, or an average of \$25 a pair, but good specimens will often bring in as much as \$150 to \$200. The old horns, which are of little value, are usually boiled down to make medicinal glue.

The musk deer is also found and hunted in Manchuria, especially in the forests of Kirin, and the musk is exported both through Newchwang and

ANIMAL & MINERAL PRODUCTS

Tientsin. The pods which arrive at the former port vary very much in size; while ten large ones go to a catty ($1\frac{1}{3}$ lb.), as many as thirty of the smaller pods are required to make up that weight. It ranges in price from forty to fifty taels a catty. Only sixty-five catties were exported by steamer from Newchwang in 1896. I am told that much of the exported article is adulterated, and it seems highly probable, for I notice that the musk exported from Thibet by way of Ya-tung and India is about eight times as expensive as the Manchurian article.

The hides of ponies and mules are dressed and manufactured into saddlery and cart gear generally. The hide of the ass is more valuable; it is dressed, coloured, and cut into narrow strips of leather an inch wide and eighteen inches long, which are exported, and used for binding the uppers, toes, and heels of Chinese shoes. In this form it is very expensive, and is valued in the Customs Returns at over \$100 a picul ($133\frac{1}{3}$ lb.). Ox hides are dressed and tanned, and the principal use to which the leather is put is the manufacture of the Manchurian shoe universally worn, stuffed with *wu-la* grass, by the working classes throughout Manchuria in winter. The uppers and sole of this shoe are one piece of leather bent into the shape of a foot, with a high tongue attached to the uppers to keep out snow. This *wu-la* grass (*ts'ao*) grows in the marshy lands of Manchuria, especially in the Kirin province, to a height of two to three feet, when it is cut down, made into bundles, and beaten by mallet until it is

MANCHURIA

soft enough to be used for padding. Ass and ox hides are also boiled down to make glue, but the product from the ass, although called glue, is in reality a medicine called *A-chiao*, so named from Tung-a Hsien, in the Shantung province, where there is a well celebrated for the excellence of its water and of the herbage which surrounds its mouth. The term *A-chiao* was originally applied to the glue derived from the hides of donkeys which browsed on this herbage and drank the water of this well, but it is now applied to ass-hide glue throughout the whole of China. The *A-chiao* of Mukden is famous.

There is another animal, a native of the province of Hei-lung-chiang, whose skin is highly valued for clothing in these cold northern regions. It is called Han-tan-han, and, although the skins are brought to Kirin from Tsitsihar in considerable quantities, I have failed to obtain even a description of the animal. It is supposed to belong to the deer family; at any rate the hair is removed and the skin is worn in the same way as chamois leather is sometimes worn with us in severe weather. Since writing the above I have examined the prepared skin of one of these animals, and the tufts of brown coarse hair on the edges leave no doubt that it belongs to the deer family. The skin is much whiter and thicker than the ordinary chamois leather of commerce, and almost as soft. The skins are large, and the one I examined cost about taels ten (\$7.50) in Kirin.

Bees are cultivated in Manchuria, the hives being

ANIMAL & MINERAL PRODUCTS

made of pieces of the hollowed-out trunks of trees about a yard long, which are usually suspended on the walls of houses. The hives are filled up at the ends with wood, a small opening being left at both ends. Beeswax to the amount of 33,467 lb., of the value of \$5,250, was exported from Newchwang by steamer in 1896. It is used principally for coating pills.

In Chapter I. I mentioned that the Amur, Sungari, and Ussuri teem with a great variety of fishes, including the sturgeon, and in the autumn with shoals of the tamara salmon, whose skins the Yü-p'i-ta-tzū utilise for making clothes. Trout also abound in the mountain streams forming their tributaries. I made an attempt to collect and forwarded to England specimens of fishes, crustaceans, and molluscs found on the seaboard near Newchwang, and the following list of identifications has been received by me through a friend from Dr. Günther of the British Museum:

CHINESE NAME	IDENTIFICATION
Pa Yü	Cybium gracile, Günth.

In addition to the above there is a species of cod which swarms in these northern waters during the autumn, and can be kept frozen throughout the winter months in Manchuria. Two species of oyster — the small rock oyster and the large sand oyster — are similarly preserved. There is also a large bivalve called Ha-la-pi, and known locally as the “Butter Fish,” which would appear to have been omitted from the box of specimens forwarded to England.

The minerals of Manchuria have not yet been scientifically explored; but gold, iron, coal, and soda are extensively worked, and silver, copper, and lead are known to exist. Gold is widely distributed throughout the three provinces of Manchuria; but the richest deposits are found in the far north, on the right bank of the Amur, the dividing line of Manchuria and Siberia. Indeed, a fellow-passenger, a distinguished mining engineer, informed me that the conglomerates which we saw in several places on

ANIMAL & MINERAL PRODUCTS

the banks of the Upper Amur are exactly the same formation as at Johannesburg. In Fêng-t'ien gold is known to exist at two places in the Liao-tung Peninsula, in the east near the city of T'ung-hua Hsien, and a few miles to the north of Mao-êrh-shan, between the Ya-lu River and the Ch'ang-pai-shan Mountains. In Kirin it is found forty miles to the north-east of Hun-ch'un, near the Russian frontier, in the bed of a tributary of the Tumên, still further north in the valley of the Sui-fên River, which flows into the Amur Bay on which Vladivostock stands, sixty-five miles west by north of Hun-ch'un in another tributary of the Tumên, on the banks of the Upper Sungari and its tributaries, and seventy miles to the east of San-sing—a town at the junction of the Sungari and the Hurka or Mu-tan River—near the headwaters of a river which flows into the Sungari to the north of that town. In the Hei-lung-chiang province I noticed between the mouth of the Sungari and Blagoveschensk, and on the right bank of the Amur, the gold-mining camps of T'ai-p'ing-k'ou, between the Russian villages of Hingan and Pompeevka on the opposite bank, and at Kuan-yin-shan, opposite Raddevka. There is another Chinese mining camp fifteen miles north-west of Blagoveschensk, and forty miles east of the junction of the Shilka and Argun is Mo-ho, the most important mining camp in Manchuria, on the right bank of the Amur, about a mile above the Russian village of Ignashina or Ignatina. The mines themselves lie twenty-three miles inland. Here rich deposits of

MANCHURIA

gold are found in the bed of a small tributary of the river which joins the Amur below Albazin. I visited the camp at Mo-ho, but the information I collected there was conflicting and it was difficult to understand the exact situation. Gold is also washed in the beds of the Arakan, which joins the Argun thirty-five miles south-west of its confluence with the Shilka, and the Urgi, a tributary of the Kang, which enters the Argun between Staro- and Novo-Tsuruhaitu. Gold is no doubt found in other parts of Manchuria, but the above are the best known centres. Most of the mines are worked by companies under Government superintendence and control, and civil and military authorities and troops are stationed thereat for their administration and protection against armed robbers, who have in the past frequently attacked the mines. I had often heard that much of the gold which finds its way from Manchuria to the port of Newchwang is of Siberian origin, and when travelling along the frontier I made particular inquiries on this point. What I learned was this, and I give it for what it is worth. I was told that the Russian Government claims the right to purchase all gold mined in Siberia, and that it pays the miners 15 to 25 per cent. less than the market value of the metal. The result is that gold is smuggled across the Amur and sold to Chinese, who pay higher prices than the Russian Government. As many of the miners in Siberia are Chinese, there is little difficulty in carrying on the contraband traffic. Another story I was told is that some Chinese high

ANIMAL & MINERAL PRODUCTS

officials, who are shareholders in Manchurian gold mines, are also proprietors or part-proprietors of Chinese banks, and that they are able so to manipulate the affairs of the mines that the gold is sold to their banks much under its real value. The one story is probably as true as the other, and there may be some connection between the latter and the following extract from an Imperial Decree published on 11th July, 1899: "As regards the Mo-ho gold mines, which have already provided funds for public use, the procedure has been entirely satisfactory. The amounts lately received have, however, been growing less and less, and orders must be given for a thorough reorganisation of the mines' affairs." The paragraph which follows the above extract from the Imperial Decree gives another reason why the finances of enterprises under Chinese Government control are never reported as flourishing except at the very outset: "The Ch'ien An gold mine, lately opened in the province of Chihli, has shown a profit in a remarkably short time. Regulations for its contribution to revenue must also be made"! That the precious metal is found in some abundance in the province of Fêng-t'ien will be seen from the following extract from a letter written by a correspondent at Mukden to the *North China Herald*, published in Shanghai: "We have a small Klondyke in Eastern Manchuria. In the spring of last year some travellers were seen in small inns to the east conveying several large bowls full of rich red gold. These travellers became so common that curiosity

MANCHURIA

of the most eager kind was aroused. They were discovered to be hard-working farmers and farm-labourers in a certain valley where they had discovered the gold, and had quietly dug away without informing the authorities. The rush last autumn to that particular place was so great that the authorities soon heard, and therefore sent men there to keep order. It is said by spiteful dwellers in the east that far better order would be kept there if no soldier appeared. That, however, did not keep the soldiers back. Some of the more lucky made as much as twenty Chinese ounces per day. It says a good deal for the wisdom of most of these men that when they had a few days of such work they quietly went away with their spoil to enjoy it. During the three last months of the season preceding the hard frost 5,000 Chinese ounces of gold were reported. How much disappeared without such report my informants were unable to say. Some Korean labourers, who made as much as taels 200 in a fortnight, felt constrained to have a jolly time, and when the money was spent went to work again. This goldfield, the richest ever found in Manchuria, is on the western slope of a low hill, whose acclivity is so gentle that it is wholly cultivated. A small stream ran down its side, and laid bare a reddish yellow earth beneath the usually clay colour so general in our soil here. In this reddish earth was the gold found. A bowl full of that produced several ounces of gold. The gold is of the richest red variety, and commands the highest price of any gold in

ANIMAL & MINERAL PRODUCTS

the market. Excitement is great and widespread. Though the course of that stream was barely the sixth of a mile (half a *li*) there were over 2,000 diggers at work. There are twelve men to each claim: one to superintend, one to cook, and ten to work. They share equally. The claim is large enough to admit two men, one with a mattock, the other with a spade. But it is rather tight work for the two to stand there at one time. A great rush and much trouble are expected with the relaxing of the frost's tight grip. At present Chinese are not allowed even to go to look into the numerous pits. It appeared to me that there was no particular reason why the rich deposit should be confined to that small stream. The same soil and the same sub-soil are spread over a considerable area. In very many other valleys I have seen or heard of gold-finding, but none to compare with this particular place. In the others gold lies deep down among gravel; but in this it is in the rich yellow earth. Here is a problem. Such gold is usually described as having been washed away from some higher point, where time, the season, and the rains tore it from the grasp of its parent rock. Here there is no higher point; for the low hills run parallel with mountains of considerable altitude, but separated from them by valleys. The rock must, therefore, have rotted away *in situ*, leaving the gold embedded in the earth, into which the rock became transformed. Rotten quartz abounded to the east of this goldfield. Externally a lump of quartz

MANCHURIA

looked as quartz usually does, but when broken it was in almost every instance covered in the fracture with a rust-like colour."

There are extensive coalfields in the Fêng-t'ien province — in the department of Liao-yang, to the south and south-east and north and north-east of Mukden — where excellent coal is mined, in the centre and west of the Liao-tung Peninsula, and in the south-west and east of the province generally. A much softer coal is found in the province of Kirin, near the city of that name, and other mines have recently been exploited by Russian engineers in search of fuel for the use of the coming Trans-Manchurian Railway.

Iron is found to the north of the Liao-yang coalfields, more especially within the district of T'ieh-ling, forty miles north of Mukden. In fact the presence of iron gives the district its name, T'ieh-ling meaning "Iron Range." It is also found in the east of Fêng-t'ien.

Asbestos is met with in the district of Huai-jên, in the east of the Southern province.

Soda is found and worked in the south of the Heilung-chiang province, whence it is exported in cakes to Southern Manchuria and Northern China, where it is largely used in dyeing establishments and to dissolve the gum of cocoons in silk reeling.

CHAPTER VI

SPECIAL INDUSTRIES

IN discussing the agricultural and animal products of Manchuria I have in some cases touched lightly, and in others fully, on the industries to which they have given rise, such, for instance, as silk, vermicelli, indigo, etc.; but there are one or two industries of great commercial importance, such as bean-cake and bean-oil, salt and *samshu* (*shao-chiu*), a native spirit, which deserve a more detailed description, and it is with these that I propose to deal in this chapter.

I have enumerated the various kinds of beans containing oil or fat, and I shall now proceed to explain the method adopted in Manchuria for extracting the oil. A large stone wheel of dressed granite about ten feet in diameter and two and a half feet thick at the axis, gradually contracting to a foot at the rim, which is smooth, revolves in a circular well from thirty to thirty-six inches broad, paved with stone and bounded on each side by a low wall of concrete or wood two to three feet high. The massive wooden axle on which the wheel revolves has its opposite end firmly fixed in a huge beam which rises vertically from the centre of the hollow

MANCHURIA

circle formed by the inner wall of the well and which revolves with the wheel. Behind the wheel and supported by a plank fixed near the opposite end of the axle is a wooden framework which just sweeps the floor of the well. The front of this framework has a metal share like a plough, and affixed to the rear is a small square of wood inclined to the inner wall with a loop of rope or leather nailed to and projecting from it. The beans to be crushed are heaped in the well against the inner wall. Two mules, blind folded, are harnessed to the wheel, one in front, the other behind, and walk in a track outside the outer wall. At the first revolution nothing is crushed; but the loop at the end of the framework drags the beans on to the floor of the well and at the second revolution these are crushed by the wheel and swept towards the outer wall by the share, making way for a fresh supply of beans dragged on by the loop arrangement at each revolution. In this way the beans are crushed into thin wafers; but this style of wheel is now somewhat antiquated, and has been to a great extent superseded by an improved method of feeding and crushing, which I shall now describe. A massive stone roller, measuring forty-two inches long with a diameter of fifty-three inches, has the centre of its rim cut to a depth of a quarter to half an inch and polished. The breadth of the cutting is nineteen and a half inches, leaving a margin of dressed but not polished granite on each side eleven and a quarter inches broad. On a circular platform edged with polished granite eighteen and a half

SPECIAL INDUSTRIES

inches wide, with a gutter or hollow all round twenty-three inches across — the whole enclosed by a low wall of stone or wood the height of the platform — this granite cylinder is placed so that the polished centre rests on the stone edging. It is kept in position by a long round beam which rises from the centre of the platform, wherein it is firmly fixed, and passes through the centre of a stout plank into the inner side of which the projecting iron axle of the cylinder fits. The iron axle on the other side of the cylinder fits into a similar plank, and these two planks are bound together at the ends, which project some distance beyond the cylinder, by two similar stout planks. At the point where the beam passes loosely through the inner plank both beam and plank are bound with iron, and the top of the beam is firmly fixed to a beam in the roof of the house. Two mules, whose track lies outside the low encircling wall, are harnessed to the projecting ends of the planks, and, as they walk round, the cylinder and wooden framework revolve round the centre beam. To the other side of the plank, through which the centre beam passes, a wooden feeder is attached. It is four-sided, about three feet high, wide at the mouth and contracting towards the bottom, which just rests on the stone edging of the platform. In the rear of the feeder and close to the platform there is a small square hole, the opening and shutting of which is regulated by a wooden slide, and attached to the rear and outer side of the feeder is a wooden hoop which prevents

MANCHURIA

the beam from rolling from the platform into the gutter. Behind the feeding hole a hoop of iron with holes drilled in the lower edge is fixed for the purpose of spreading the beans evenly on the stone edging of the platform, and attached to the front of the feeder and grazing the platform there is a narrow iron share arranged in a slanting direction, so that it sweeps all before it into the gutter. Let us suppose now that the mules have been harnessed to the planks projecting beyond the stone cylinder or crusher, and that the feeder is full of beans and the slide open. As the mules walk round, the beans escape from the feeder and are spread evenly on the stone edging of the platform by the perforated iron hoop or rake, and prevented from rolling into the gutter by the wooden hoop. Round comes the cylinder and crushes the beans into wafers, which at the next revolution are swept from the platform into the gutter by the share in front of the feeder. The first process, that is, the crushing of the beans, is now complete. The bean wafers are then removed from the gutter in baskets and steamed. A number of brick furnaces two to two and a half feet high are fitted on the top, with large open shallow circular iron pots more than half full of boiling water. A couple of inches below the lip of each pot a circular wooden grating is inserted, and over this is spread a square piece of coarse hempen cloth. When the water boils the steam ascends through the grating and cloth, and on the latter a basketful of bean wafers is spread and steamed for a quarter of an

SPECIAL INDUSTRIES

hour, when they are sufficiently soft to be moulded into cake for the oil-press. I have weighed these bean wafers before and after steaming and found the weights to be $54\frac{1}{2}$ and $60\frac{1}{2}$ catties respectively. Two iron rods of equal length are placed parallel to each other on the ground, and two similar rods are laid crosswise and parallel on the top to form a square in the centre. On these two stout iron hoops, twenty-three inches in diameter and two inches deep, are placed, and on these again a thin bottomless wooden filler of like diameter and eighteen inches high is adjusted. Two bunches of grass, each tied at the base end, are, after being steamed, fitted into the wooden filler, the tied ends downwards, and the loose ends are spread fan-shape over the rim of the filler. Another thin piece of wood seven and a half inches deep is then bent by hand into a second filler — the edges overlapping — and pushed down on the top of the grass inside the large wooden filler. The steamed beans are now carried from the grating in the piece of hempen sacking, poured into the inner filler and hammered down, the workman afterwards stepping in and pressing them hard with both feet. While thus engaged he draws up the inner filler, and, when the beans are sufficiently pressed, he bends down, raises the outer filler and adjusts the iron hoops an inch or more apart on the grass now containing the beans. This done, he steps out, removes both fillers, and, seizing the ends of the grass with his hands, carefully arranges them towards the centre to cover the beans. Two short

MANCHURIA

iron rods are now placed on the top to keep the grass down. On the top of this grass-wrapped cake four other cakes are similarly moulded, the short iron rods being removed from the top of the cake below as the cake above is completed. A side view now shows five grass-covered cakes, one above the other, each bound with two iron hoops. They are now ready for the oil-press. This consists of four massive wooden pillars, some ten feet high, embedded in the ground, and arranged in two pairs at a short distance from each other, each pair bound together at the top and forming an angle. A log of wood fixed horizontally in the apices of the angles binds the two pairs together. In the floor between the pairs of pillars is embedded a thick, round base of willow wood guttered all round, and with a mouth leading to an underground tank for the reception of the oil. The five cakes are dragged on to the base, the short iron rods are removed from the top cake, and three short logs — the ends facing the workman — are laid on the top of the cakes. Above these are placed crosswise longer logs passing through the two angles made by the two pairs of pillars until the space between the cakes and the cross log uniting the pillars is filled. Wooden wedges, bound at the thick end with iron, are now driven in between the upper logs at each side by the workman, who wields with great effect a heavy, short-handled iron hammer suspended at each side from a cross beam erected above the press. After a few minutes the oil may be seen pouring from the cakes, descend-

SPECIAL INDUSTRIES

ing to the wooden base, and thence finding its way to the underground tank. From time to time the wedges are knocked out, another log inserted, and the wedges again driven home. This process goes on for two hours, when the extraction is complete. The cakes are then dragged from the press and the iron hoops and grass casings removed. Each cake is now a solid mass, twenty-three inches in diameter and four inches thick, with a slight protuberance all round the centre of the edge, caused by the great pressure on the weak part of the cake between the two iron hoops. Each cake is taken separately, and the protuberance pared off by means of a double-handled, semi-circular knife. The parings weigh about two catties and the trimmed cakes fifty-three catties each, a total of fifty-five catties when removed from the press. But the steamed beans when inserted weighed sixty and a half catties, and the difference of five and a half catties, or over ten per cent. for crushed beans weighing fifty-four and a half catties, should represent the quantity of oil extracted. I am assured, however, by many that nine per cent. may be reckoned a fair average. After being trimmed the cakes are stored in godowns ready for shipment to Swatow and Amoy, where they are macerated and applied to the sugar-cane fields as manure. Even in the godowns they lose weight, and when they reach their destination it not unfrequently happens that a cake weighs less than fifty catties. Beans, bean-cake, and bean-oil vary greatly in price from year to year. In the decennary ending

MANCHURIA

1891 the average values were: Beans, Newchwang taels 2.91 per picul of 300 catties (400 lb.); Bean-cake, N. taels 3.69 per ten pieces, and Bean-oil, N. taels 3.43 per picul of 100 catties.

During recent years the prices have been higher; in 1897 they were N. taels 4.95, N. taels 5.8, and N. taels 7.3 respectively. This oil is used for both cooking and lighting, and is exported by steamer and junk to all parts of China. Up the Yang-tezs, however, and in the southern provinces, it has rivals in the so-called tea-oil and ground nut-oil manufactured from the seeds of *Camellia sasanqua*, *Thunb.*, and *Arachis hypogæa*, *L.*, respectively. In 1896 a bean-oil factory with foreign machinery manufactured in Hong-Kong was erected in the port of Newchwang. The beans are crushed between pairs of iron cylinders driven by steam, and the crushed bean wafers, treated as above described, are placed in iron screw presses turned by capstan bars by hand. With this exception the process of manufacture is the same as in the native mills. In the foreign mill the oil is pumped from the underground reservoirs into iron tanks, where it is stored before being run into the wicker waterproof baskets for shipment. Oil extracted in the mills in the far interior of Manchuria is packed in large waterproof boxes to enable it to bear the rough transit by cart to the port, and on arrival at Newchwang the boxes are opened and the oil transferred to baskets for export.

In the low-lying lands of the Liao-tung Peninsula, and more especially between the port of Newchwang

SPECIAL INDUSTRIES

and the city of Kai-p'ing Hsien, where a number of creeks penetrate inland from the sea, much of the ground is given up to the manufacture of salt by sun evaporation. Previous to visiting these salt fields I was under the impression that sea-water was simply run on to the fields and allowed to stand there until the water dried up and left a deposit of salt; but I found on personal examination that the process is much more elaborate, and is carried on not without a certain amount of rude science. Nearest to the creek or open ditch leading from the creek — these ditches ramify all over the saltfields — are five large square or oblong plots of land (Shui Chüan) sunk in the soil, each carefully dyked and capable of containing water two to three feet deep. Small openings, which can readily be closed by pieces of wood, allow the water to run from the first plot or tank into which the sea-water is baled from the creek or ditch to the second, third, fourth, and fifth, tank. Next to these tanks are eight similar but smaller tanks (Lu Tang), and beyond six and sometimes eight similar but smaller tanks (Yen Chih), in the last of which the salt ultimately crystallises. The three sets of tanks all communicate with each other by means of small openings in the dykes, which can be closed at will. In the first two sets of tanks the beds or floors are flat, but in the last set, which are shallower, they rise gradually from edge to centre. In the end of autumn the beds of the last set of tanks (Yen Chih) are beaten hard by wooden mallets — the soil is clay — and sea-water

MANCHURIA

is run into them through the other sets of tanks. That is allowed to remain frozen over winter, and in spring the beds of the Shui Chüan and Lu Tang are levelled and beaten hard. When the water thaws in the Yen Chih it is carried back by a small drain to, and stored in, the third and fourth of the Lu Tang or middle set of tanks. This water is now called the Lao lu or old brine, and the workmen contend that crystallisation is hastened by the sea-water passing through it from the Shui Chüan on its way to the Yen Chih. When the old brine is removed from the latter the beds are again hardened. Everything is now in order for the manufacture of the salt. The Shui Chüan are ready for the reception of sea-water from the creek, the third and fourth tanks of the Lu Tang are full of Lao lu (old brine), the other six being empty, and the Yen Chih are also empty. When the Shui Chüan are full the water at once passes on to the Lu Tang, mingles with the Lao lu, and remains there eight days. Science now steps in. The headman has to say when the time has arrived to allow the water to pass through the last of Lu Tang to the final set of tanks (Yen Chih), *i.e.*, to test its specific gravity. This he does by using the egg-shaped seeds of the lotus. It was only after an hour's cross-questioning — the Chinese mind works in a series of curves — that a headman produced from a small bag hung round his neck by a cord under his clothes four lotus seeds of different colours and weights. They represented, according to him, thirty, fifty, eighty, and

SPECIAL INDUSTRIES

a hundred per cent., and when the heaviest, that is the last, floated on the surface of the water, the time had come to allow the water to escape from the Lu Tang into the final set of evaporation tanks (Yen Chih). Not all, however, for as Lao lu (old brine) must be retained in the Lu Tang for the next supply of sea-water, only one-half is permitted to flow into the Yen Chih. Much now depends upon the weather. In the hottest and brightest days of summer salt crystallises in the final tank in forty-eight hours; but three to four days are usually required in spring and autumn. Ten to fourteen days, therefore, may be reckoned as the time necessary to complete the manufacture from the time the sea-water enters the Shui Chüan till the salt falls in large crystals on the bed of the final tank, whence it is scooped up by means of a wooden rake and spread out to dry. When it has been collected the water from the next tank takes its place, and so the process goes on. The crystals are large — some clear as glass, others white and opaque, while others again are dingy and muddy. The purity of the salt depends, in a great measure, on the hardness of the bed of the final tank. If it is at all soft, mud is scooped up with and discolours the salt. On an average five piculs (a picul of salt weighs about 600 catties or 800 lb.) are collected from the final tank at one time, and the average production of a set of tanks for seven months' working amounts to 300 piculs (of 800 lb. each), or $107\frac{1}{7}$ tons. Much, however, depends upon the season: dull or rainy weather

MANCHURIA

retards the evaporation. The price of salt at the works is from 12 to 13 tiao (roughly speaking, 6 tiao are equal to 1 Mexican dollar) per picul (800 lb.), and the tax per picul of the same quantity payable by the buyer at the Salt Collectorate Office near at hand amounts to $7\frac{1}{2}$ tiao, or more than 50 per cent. *ad valorem*. The cartage per picul from the place of production to the port of Newchwang is 4 tiao, bringing the price per picul at the time of shipment for the interior of Manchuria up to 24 or 25 tiao, or about \$4. To avoid this cartage, boats which have come down from the interior with beans frequently ascend the creeks, load a little salt and return to the port to fill up with return cargo. The shallowness of the creeks prevents their taking full cargoes at the works.

The production of spirit from grain (Millet — *Holcus sorghum*, *L.*), as carried on in Manchuria, is the same in principle as elsewhere, depending as it does on the development of grape sugar from starch in the grain and on the action of a ferment on the sugar generating alcohol, which is separated by distillation. The process, however, is vastly unlike that practised in the West. The various operations are not so clearly differentiated, since, with the exception of distillation itself, they proceed together at the same time, and grain in different stages of decomposition is mixed in the same receptacle. The Manchurian method displays considerable ingenuity of a rough kind, and is evidently the result of prolonged observation and gradual adapta-

SPECIAL INDUSTRIES

tion of means. It is, on the whole, simple in appearance, though troublesome in operation. As in all distillation processes, even where a great number of men are employed, the "making or marring" of the work is in the hands of a few skilled workmen, whom long experience has made expert. These men do not allow the inner practical secrets to pass from them easily, as the commanding of a good salary here, as elsewhere, requires that the supply does not exceed the demand, and they are therefore trades unionists to the extent of objecting to apprentices. A first-class distiller has an easy time, and, for a Chinese, an enviable salary. Of course these men understand the process merely as a practical one; no theoretical study or explanation is attempted.

The operation demanding most experience and skill is the preparation of the fermenting agent. In all places the components of the ferment are not alike, but, as a rule, three parts of barley (Ta Mai) to one of peas (Hsiao Tou) are the proportions generally used. This mixture is ground coarsely, the barley husks not being removed. To this water is then added until the whole is of the consistency of putty, when it is pressed firm by foot into wooden moulds in size and shape like brick moulds. When firmly shaped these grain bricks are removed and piled in a room just as bricks are piled in a kiln with interstices for the free passage of air, to the height of four or five feet, 6,000 to 10,000 being made and piled at one time. Now it is that the skill of the expert is called for. The room is closed up, any

MANCHURIA

cracks in doors and windows being at first carefully papered over to exclude the air. Abundance of light and heat comes through the paper windows, but no air or draught is permitted until the correct temperature is reached and the process of fermentation induced by the heat of the room and the moisture and heat of the grain bricks themselves. Gradually a fungoid growth forms on the surface, and the skill of the operator is now required to keep temperature, moisture, etc., under control until this change has permeated the entire substance of the bricks. He does this by opening windows, by using artificial heat, or by repiling the whole or part of the bricks as he sees needful. About forty days are necessary to perfect the ferment. In spring artificial heat has to be employed, and in summer it frequently happens that the temperature has to be reduced by currents of air. In winter the ferment cannot be manufactured, and provision is made in the spring and summer months for a supply sufficient to last the whole year, and there is usually some old stock in hand when the new year's is ready for use. The ferment (Ch'ü-tzŭ), when properly dried, will retain its active properties for even five or six years. A moderate-sized distillery has in the season several batches in course of preparation at different stages, each batch consisting of from 5,000 to 10,000 bricks, and possesses in addition a large stock of the perfected and dried material.

The preparation of the grain is carried out in a curious way. Whereas by the Western process

SPECIAL INDUSTRIES

germination is induced by moist, and arrested by dry heat, in the development of grape sugar in Manchuria the grain is first crushed and afterwards moistened. Then a quantity of the ferment is ground fine, added to the grain, and thoroughly mixed with it. The whole is thereafter put into pits, tramped layer by layer, covered over with chaff, and a layer of moist clay — the red clay of Manchuria is very tenacious — spread over all. The latter forms an air-proof cover, beneath which all the chemical changes in the grain antecedent to distillation simultaneously proceed, great heat being developed. For eighteen days the contents of the pits are daily tramped “home,” to keep the grain in close contact with the ferment. At the end of this period the grain on being removed is partially decomposed, has a sweet, spiritous taste, and is ready for the first distillation. I should have mentioned that from time to time an opening is made in the clay covering, and an iron bar thrust in several places down to the bottom of the steep pit. (By analogy it may be so termed, though the grain is only moist.) This has a twofold object. The operator can ascertain the stage of decomposition by sense of smell, which is spiritous as the time for distillation draws near, and the gas developed in the meantime is allowed to escape. The fact that an unskilled hand, if attempting to test too closely the state of the grain by smell, may collapse from the effect of the gas escaping shows that poisonous carbonic acid gas is developed

MANCHURIA

here just as in the Western method of manufacture.

The above is a brief statement for the sake of clearness; but, in practice, the process is somewhat more complicated, as the grain is successively subjected to the action of the ferment and distilled five times before it is regarded as refuse and discarded in the shape of "grains." Evidently experience has shown that only a surface action takes place in successive operation, that the grain is only partially acted on by the ferment each time, and it is never — unless when a distillery is first opened — subjected continuously to the action of ferment for more than nine or ten days at a time.

In some parts of the country where millet is cheap and labour dear the grain is not subjected to distillation five times. It is rejected as valueless after the fourth, and in this case, therefore, no raw grain is added to any but the first two layers. What has been distilled twice will not have any grain added, as its contents could not be exhausted in time.

For the market the products of the successive stillings are mixed together, but there are always ways and means of procuring the best stillings if required. The quantity of spirit yielded by one stilling, in which 42 bushels (1 bushel equal to 40 lb.) of millet are used, is at best 800 lb.; but it very often falls far short of that amount.

I should mention that the work of distillation goes on continuously night and day, and that the

SPECIAL INDUSTRIES

men divide their work into alternate batches, each gang taking complete charge of one stilling.

Owing to the long distance which separates the producing from the populous centres, and the consequent heavy overland freight, numerous distilleries are scattered about the former, and these consume large quantities of millet in the manufacture of *samshu*, which, being less bulky and more expensive than the grain, can be profitably conveyed to the seaboard for shipment. Even at the time of export this spirit is absurdly cheap, being valued at less than 3 cents per lb. in weight. In the distilleries it is put away in willow baskets lined with tough waterproof paper as well as in earthenware jars carefully stoppered with clay. This spirit finds a ready market throughout China, and is exported in large quantities both by steamer and junk, chiefly the latter, from Newchwang.

CHAPTER VII

TRADE OF MANCHURIA

THE remarks already made on the subject of climate will have prepared the reader for the peculiar conditions under which the trade of these northern latitudes is conducted. With the exception of the extreme south of the Liao-tung Peninsula — Kuan-tung as it is called — the whole of Manchuria is ice-bound for at least four months of the year, from the middle of November to the middle of March in the south and from the middle of October to the beginning of May in the far north, when all water-borne traffic ceases. The closing and opening of the rivers may be a little earlier or later according to the severity or mildness of the season. At Newchwang, for example, the Liao River, if not actually blocked by the end of November, is dangerous to navigation owing to floating ice, and in the years 1898, 1899, and 1900 it broke up on the 2nd of April, 10th of March, and 23rd of March respectively; in Central Manchuria the Sungari at Kirin closes about the middle of November (on the 15th in 1895) and opens at the beginning of April (on the 2nd in 1896); and the Amur in the extreme north closes in October and opens

TRADE OF MANCHURIA

early in May. Virtually, therefore, navigation in these inland waters closes from four to six months out of the twelve, and all trade during these months has to be carried by land or on the ice. In the centre and north, where there is a heavier snowfall than in the south, sledges are in common use both for passengers and goods; but the merchandise thus transported represents only a fractional part of the total winter traffic of the country. Carts are the railway carriages, trucks, and vans of Manchuria — small covered carts with two or three animals for passengers and light valuable produce such as opium and silk, and large open carts with teams of from five to seven mules or ponies (mostly the latter number) for bringing the heavy and bulky products of the interior to the great depots of trade on the banks of the rivers, there to await the opening of navigation in spring, and for conveying back into the interior the necessaries and luxuries of life, such as salt, sugar, Chinese produce generally, and foreign manufactures. This trade, as I shall show hereafter, is immense, and it might be supposed that some care would be taken to keep the roads on which it has to be conducted in decent repair; but the absence of stone in the neighbourhood of the alluvial soil over which the great commercial highways run in Western Manchuria and Eastern Mongolia precludes that care being exercised even were it contemplated, and during the rainy season — July and August — the roads become quagmires, wherein carts and their teams, when they attempt the carriage of goods at

MANCHURIA

that season, flounder for days and weeks. Later, these roads with their deep ruts are frozen solid, and, as caravan after caravan of heavily-laden carts rolls along, the ridges are powdered into the ruts, leaving, towards the end of the winter, the surface smooth and slippery, with here and there deep depressions — dangerous pitfalls, where the unwieldy carts are frequently upset.

The nature of the roads has led to the building of carts capable of withstanding the bumping and jolting to which they are constantly subjected. Elm and oak are the materials used in their construction, and the framework of the cart — I am speaking now of the large open carts — rests, by means of beams of wood affixed to and under each side in the centre and lower half of which a semi-circular piece is removed, on a huge axle-tree joined to two wheels with iron tires more than an inch thick. These tires, about two inches wide, are made up of curved lengths of iron, nailed in a groove to the felloes of the wooden wheels, which revolve with the axle. To add to its strength pieces of iron are let into the axle, where the blocks under the framework rest upon it. A wheel has three spokes, one a massive beam and two smaller beams at right angles to and passing through it. The large spoke is clasped with iron bands, and the side of the wheel is studded with large iron rivets. On each side of the cart there is a low wooden rail extending backwards (not, however, to the tail), and over this rail and on the body of the cart produce is loaded to a considerable height, and

TRADE OF MANCHURIA

of a weight of from two to three tons. But the load is always so well balanced that there is no pressure on the back of the pony in the short shafts. In front of this pony there are usually two rows, three abreast, of ponies, but more frequently mules, the row next the pony being attached to iron hooks on each side of the body of the cart by long hempen ropes or traces fixed to their collars, and the front row in a similar manner to the shafts.¹

The mules in each row are loosely joined to each other by ropes connecting their collars, but they have neither bits, bridles, nor reins, being guided by the voice of the driver, who, perched on the top of the load in front, wields in both hands an enormous whip, long enough to cover the whole team. With it he can snip any animal which shows the least disposition to play the laggard.

Such are the roads and the means of transport for conveying the produce of the far interior of Manchuria and Eastern Mongolia to places of shipment on the great trade artery — the Liao River. Many thousands of carts come into the port of Newchwang (Ying-k'ou or Ying-kow) every winter; but as the season advances and the roads begin to soften they unload at such places as T'ien-chuang-t'ai, Hsin-min T'ing, T'ieh-ling Hsien and T'ung-chiang-tzū — the

¹The following are the actual measurements of a cart:

Length	15	feet.	Distance between shafts	26½	inches.
Breadth	47	inches.	Circumference of axle .	25	"
Length of rail	58	"	Diameter of wheel . . .	43	"
Height of rail	13½	"	Breadth of tire	2	"
Length of shafts	55½	"	Thickness of tire	1½	inch.

MANCHURIA

great depots of trade in Southern Manchuria, where the goods are stored until the ice breaks up and the river opens in spring. When the waterways open overland traffic virtually ceases, and the many thousands of animals thus let loose are employed in tilling the fields. In spring, summer, and autumn a forest of masts lines the north bank of the Liao opposite the town of Newchwang (Ying-k'ou), proclaiming that thousands of boats are bringing down the produce stored in the depots mentioned above. Towards the beginning and middle of November they disappear into the interior, where they are drawn up and beached on the banks of the river till the ensuing spring. Some years ago it was estimated that 13,000 boats, varying in capacity from $7\frac{1}{2}$ to $14\frac{2}{7}$ tons, were engaged in this carrying trade, and that each boat made eight trips on an average during the season, bringing down for export beans, grain, tobacco, hemp, and other produce, and taking back salt, old iron, and general cargo. They are manned by crews of from three to five men, according to size. To-day, owing to the enormous development of trade in Manchuria during the last few years, it may be stated with perfect safety that they number not less than 30,000, and every year even the most unobservant eye cannot fail to detect the large admixture of new craft.

A review of the history of the trade of Manchuria would show, as might be expected, that it increases exactly in proportion to the increase of facilities for exporting and importing goods.

TRADE OF MANCHURIA

The recently concluded treaty between Russia and Japan relating to the operations of railroads and to commercial transactions in Manchuria has special interest because of the bearing upon this policy of the "open door." All nations are to have equal privileges, which means conformity to the principle advocated by the United States even before the Russo-Japanese War. And an indication of the good faith of Russia and Japan is found in the abandonment of Port Arthur as a military and naval base. It is now simply a commercial port, to which use it is admirably adapted. The latest available reports of the trade conditions of Japan are furnished by Vice-Consul-General Frederick D. Cloud at Mukden, and they show that the products of Manchuria are finding a place in the markets of the world, and that each successive step in the throwing open of her ports, the building up of her railway system and the organisation of her financial methods increases her consumption of the products of the world and extends her commercial relations with the Great Powers. These reports furnish the material for the rest of this chapter.

One promising feature of the export trade is to be found in the new outlet to Europe and America for Manchurian products. For the first time beans are now exported to England and the Continent at fair prices. The shipments are more or less experiments, but in 1908 some 30,000 tons were shipped to Great Britain.

The improved transportation facilities afforded

MANCHURIA

Manchurian farmers, together with improved methods of handling the crops, are stimulating production. The beancrop of 1908 was the largest ever produced in Manchuria, and it is to meet this increased production that wider markets are being sought. There is little doubt that Manchuria is to become, in the not far distant future, a competitor of America in supplying agricultural products for the markets of Europe. That Manchurian flour and low grades of flour milled in Shanghai and Hong-kong are already strongly competing with the American article in Manchuria has become an established fact, evidenced by the falling off of the import trade during the year. The flour mills of Harbin and the new milling enterprises of the Japanese are placing their products upon the local markets at prices with which it is impossible for American mills to compete. The superior quality of the American brands is not questioned, but the Manchurian consumer's purchasing power is too limited to enable him to buy any but the cheapest grades, not only of flour, but also of the whole round of daily necessities. To increase the large native population's purchasing power therefore is to increase Manchuria's trade with foreign countries, and the only way to achieve this is to develop its agricultural resources by improved methods of cultivation and by creating new and larger markets for its products. What the United States may lose through diminished sales of farm products must more than be made up through increased trade in manufactured goods.

TRADE OF MANCHURIA

According to the official returns the total value of the import trade of Manchuria for 1908 passing through the custom-houses of Newchwang, Dalny, and Antung amounted to \$31,954,298, United States gold. Of this amount \$25,153,861 was imports from foreign countries, while \$6,800,437 represented the value of goods, mostly of Chinese origin, imported from other Chinese ports. In addition to the purely foreign imports, however, there should be mentioned an item of \$10,000,000 worth of railway materials imported from the United States by the South Manchuria Railway Company, on which no duties were paid, and which was omitted from the Chinese Customs Returns. What further imports entered Manchuria by way of Tientsin and Harbin it is impossible to state, but assuming that \$10,000,000 of imports entered by way of these two cities the total value of Manchuria's incoming commerce from foreign countries aggregated approximately \$45,000,000. Of this amount about \$16,000,000 worth came from the United States, of which \$10,000,000 consisted of railway materials and the balance represented America's share of the miscellaneous merchandise imports.

The principal articles of American origin were cotton goods, kerosene oil, lumber, and flour. The imports of American kerosene amounted to 8,000,000 gallons; cotton goods, a trifle more than 1,000,000 pieces; lumber, 3,500,000 feet, and flour, 250,000 barrels. The sale of American cigarettes also reached large proportions, but only a small number of them

MANCHURIA

was exported direct from the United States. There were substantial increases in the imports of American cotton goods over those of 1907, and the outlook in this line of trade is very encouraging. The same is also true of kerosene oil. The imports of American flour, however, decreased heavily, which was due to the marked decline of silver, coupled with the competition of flour of local manufacture. On the whole there were substantial gains in American trade over the previous year, and there is every reason to believe that with renewed efforts and improved methods on the part of American shippers the present year will witness a still greater proportionate increase in America's share of the Manchurian import trade.

The total value of Manchurian exports in 1908 clearing through the custom-houses of Newchwang, Dalny, and Antung was \$36,282,894, and this amount was about evenly divided between exports to foreign countries and exports to China, \$18,376,968 going to the former and \$17,905,926 to the latter. The exports of beans and bean-cake amounted to approximately 754,496 tons, and were valued at \$14,880,113, an increase of \$5,029,323 over 1907. In addition, 1,930 tons of bean-oil, valued at \$136,538, were exported, making the total value of exports of bean products \$15,016,651. The item next in importance in the list of exports was wild silk, which was valued at \$3,329,921. Timber from the Ya-lu Valley was third in importance, amounting to \$2,373,000. Other exports were 18,345 tons of

TRADE OF MANCHURIA

Kaoliang (tall millet), 326,169 bushels of Indian corn, and 3,815 tons of millet, aggregating \$445,950 in value.

Added to the figures just given, which represent only the exports passing through the custom-houses of the province, should be the large quantities of all kinds of Manchurian products which are exported in native craft and which do not come under the supervision of custom-house officials. It is probably true that the official Customs Returns from year to year do not account for more than 60 per cent. of the actual exports of Manchurian products.

The total value of farm products for 1908 was approximately \$63,000,000, the value of the principal crops being estimated as follows: Kaoliang, \$28,000,000; beans, \$25,000,000; wheat, \$4,000,000; millet, \$3,000,000; other crops, \$3,000,000. The increased transportation facilities afforded by the South Manchuria and the Chinese Imperial railways are proving of great benefit to Manchurian agriculture. Farmers are not only being stimulated to increase the acreage tilled, but are also devoting more of their land to those crops having the greatest commercial value.

The Mukden Government, in co-operation with the Central Government, has devoted much attention during the year to the colonisation of the uninhabited regions of Mongolia, Kirin, and Heilungchiang. Offices have been opened in Hankow, Shanghai, Tientsin, Chefoo, and Newchwang for the purpose of inducing worthy families to become

MANCHURIA

residents of Manchuria. All intending settlers of these new regions are given special low rates on the Chinese steamship lines between Chefoo and Newchwang, and on the steamship lines of the Sungari River. Large tracts belonging to Mongolian princes have been surveyed and set aside for the settlement and the Government is offering inducements to the people of the southern and more densely populated provinces to take up this land. The land has been divided into three classes, according to desirability, the price per acre being fixed at the equivalent of \$2.75, \$1.50, and 87 cents, United States currency, respectively. One-half of the original purchase money goes to the Government as revenue, while for every \$62.10 of purchase money an additional \$9.32 is collected from the purchaser for the maintenance of the colonisation bureau. If the settler is too poor to buy the land, long-term leases are made. Under such leases the annual rental averages 20 cents per acre. No taxes on land purchased are collected during the first three years from the date of entry, and should the settlers require funds to enable them to care for their crops they may receive advances from the Government banks. These advances are made against the current crop and bear a low rate of interest. The scheme, in principle at least, is a highly commendable one. The regions thus thrown open are among the most fertile in all Manchuria, and are at present largely unproductive only because they are for the most part uninhabited.

TRADE OF MANCHURIA

Although considerable interest in the mineral deposits of Manchuria has been evinced by American, British, and German engineers during the year, but little has been accomplished by them toward the development of the country's mineral resources. The South Manchuria Railway Company, on the other hand, has pushed forward development work on the Fu-shun coal mines with great energy, and extensive additions to the equipment of the mines have more than doubled the output. At the beginning of the year the daily output was 500 tons, but by the end of December the daily product had reached 1,200 tons. The Fu-shun coal mines constitute one of the chief assets of the Company.

Practically nothing has been accomplished in the development of gold, silver, or copper mines, although considerable interest in the possibilities of gold-mining have been manifested. The Mukden Government has repeatedly made it known that it was anxious to invite foreign capital into Manchuria for mine development, but has failed to obtain a revision of the mining regulations, which alone will make possible the investment of foreign capital in Chinese mines.

Manchuria is experiencing the reaction of the large operations that occurred during the late war between Japan and Russia, when both sides spent millions. The ending of the war stopped the inflow of money, and the country is gradually being restored to its former and natural basis. During the war

MANCHURIA

the money spent went largely to dealers in provisions, to carters, and to coolies, very few of whom were natives of Manchuria, and the money earned, after being changed into sycee or silver coins, was sent to their homes in Shantung and Chihli. It is said that Japan alone during the war spent \$94,620,000 in Manchuria, and had \$29,880,000 of war notes in circulation. How much Russia spent is unknown, but it may be safely judged as more than double the amount spent by Japan.

One of the chief causes of continued trade depression in Manchuria is the heterogeneous mixture of circulating mediums of exchange in use at present. Government banks, private native banks, foreign banks, and native commercial firms are permitted to issue their own forms and varieties of obligations called "money." There are no less than twelve mediums of exchange in circulation in Manchuria: (1) the small-coin dollar, having a value of 100 cents of subsidiary silver coins of 10 and 20-cent pieces; (2) copper coins of 10 and 20-cash denominations; (3) paper currency based upon the small-coin dollar; (4) the local or Fêng-t'ien tael; (5) notes of foreign banks in roubles; (6) silver yen; (7) gold yen; (8) Mexican dollars; (9) the Mexican dollar coin; (10) the Manchurian dollar, a silver coin the weight and fineness of which is slightly greater than that of the Mexican dollar; (11) tiao notes; and (12) the square-holed copper cash. With the exception of the gold yen and the rouble bank notes, these are all based upon silver values, and are sub-

TRADE OF MANCHURIA

ject to constant and ever-varying rates of exchange, not only in relation to gold currency, but in respect to each other. It is not difficult to conceive the obstacles lying in the way of trade development where so much uncertainty exists as to the character and stability of exchange mediums. Of the total currency in circulation in this district approximately 30 per cent. is composed of foreign bank notes, distributed as follows: Yokohama Specie Bank, silver notes, 18 per cent.; Bank of Japan, gold notes, 6 per cent.; Japanese war, silver notes, $1\frac{1}{2}$ per cent.; Russo-Chinese Bank, rouble notes, 3 per cent.; and the notes of various banks of Tientsin and Shanghai, $1\frac{1}{2}$ per cent.

During the last few years the creation of Government banks has been made a means of raising Government revenue, and these in turn have issued large quantities of paper notes. The Government bank of Mukden has issued in the four years of its existence \$4,080,000 worth of notes. There has been no attempt to redeem them, nor has there been any considerable amount of these notes withdrawn from circulation. The Government of Kirin province issued approximately \$6,400,000 of tiao notes, so that the total amount of Government notes in the district outstanding at the close of 1908, expressed in United States currency, was about \$10,480,000.

The paid-up capital of the Provincial Government's bank of Mukden at the end of 1908 was \$2,685,405 United States gold, with a special reserve

MANCHURIA

fund of \$222,664. Granting that these two accounts, aggregating \$2,908,069, are in such form as to act as security against the bank's outstanding notes, there are still \$1,171,931 worth of Government bank notes in circulation for which there is no apparent security. The Government banks claim, however, that they always keep on hand a large quantity of Government revenues which they use as an additional reserve for protecting their note issues.

In addition to the Government bank notes many private banks and commercial firms have issued large quantities of notes in many denominations, and as the concerns issuing these notes do not attempt to maintain a legal-tender reserve with which to redeem them, the value of such notes depends from day to day upon the solvency or insolvency, or the reported solvency or insolvency, of the banks and firms of issuance.

Another means of raising revenue has been the minting of copper coins to replace the ancient, square-holed cash. This method of replenishing the exchequer has been employed not only in Manchuria but throughout the Empire. During 1908 the Provincial Government's mint at Mukden coined 27,000,000 copper 10-cash pieces, the approximate value of which was \$93,150, United States currency, and 15,000,000 20-cash pieces of the value of \$103,500. Previous assays of these coins have shown that the 10-cash coins, as compared with the old square-holed cash, contain only 2.7 cash worth of metallic copper. In other words,

TRADE OF MANCHURIA

the Government's nominal profit on each of these 10-cash pieces is 7.3 cash, but its actual profit is somewhat less, for the reason that the market value of the new coins has greatly depreciated owing to the public's refusal to accept them at face value. This attitude of the general public is partly due to the character of the new token money and partly owing to the Government's refusal to accept its own coins in payment of taxes and revenues.

It is this state of the country's monetary system that is proving hurtful to Manchuria's trade and public revenues. There is encouragement, however, in the action of the Central Government in issuing instructions to the provincial authorities to make careful investigation of private banks before allowing them to issue bank notes. Regulations are also being drawn up requiring such banks to submit to a system of inspection, and compelling them to provide adequate legal-tender reserves for the protection of their note issues.

RAILWAY DEVELOPMENTS

The South Manchuria Railway has been standardised and the installation of new rolling stock has greatly increased the road's carrying capacity. Under the narrow-gauge régime the line's daily carrying capacity was about 2,000 tons, whereas at the present time, with its standard gauge, new American rolling stock, and improvement in its freight service, the capacity is more than 6,000 tons. Similar improvement has been made in the passenger

MANCHURIA

service. Semi-weekly through train service between Dalny and K'uan-ch'êng-tzŭ (Ch'ang-ch'un) has been inaugurated. These trains are thoroughly modern in every respect, the cars and locomotives being of the latest designs of American make. Each train is composed of a mail car, a Pullman sleeper, a diner, and a combination day coach and baggage car. In addition to these improvements the South Manchuria Railway Company has established a weekly steamship service between Dalny and Shanghai, which shortens the time of travel between the latter city and Manchuria by two to five days, and will also bring about a reduction of freight rates. The Company is already issuing through bills of lading between Shanghai and Manchurian points.

Negotiations are in progress for the building of new railway lines, notably a line of some 80 miles from K'uan-ch'êng-tzŭ (Ch'ang-ch'un), on the main line of the South Manchuria Railway, to the city of Kirin, and for a line from Hsinmintun, on the main line of the Chinese Imperial Railway, to Fakumen, a distance of about 40 miles. The latter is to be a Chinese line, but according to the terms of an agreement with Japan the Chinese Government must borrow from the South Manchuria Railway Company one-half of the capital required to construct the road. It is also stipulated that the heads of departments in the new road's management shall be Japanese, whose appointment shall be subject to the approval of the management of

TRADE OF MANCHURIA

the South Manchuria Company. The amount of the loan from the railway company is to be \$1,069,700 for constructing the new line and \$159,360 for the repair and reconstruction of the Hsinmintun-Mukden line, a total of \$1,229,060. Negotiations are still in progress between the governments concerned, but apparently little headway is being made. It is highly regrettable from a commercial and development point of view that there should be any obstacle offered to the building of this line. The vast fertile plains of Manchuria and Mongolia tributary to the city of Fakumen are demanding that the railway be built without further delay, and furnish an outlet for the products of the farms of the region and an inlet for manufactured articles for which the inhabitants must pay, owing to the great cost of transportation at present, all but prohibitive prices.

After ice has closed the river to navigation, carts are employed to bring the inland produce to Newchwang, but this is stopped when the spring thaw sets in. Unless there have been heavy enough snows to give the requisite draft of water in the upriver reaches, or heavy rains in the spring, the use of river boats is impossible. It is believed that this condition of things might be remedied by the outlay of a little money in the improvement of the Liao, and it is only by prompt measures in this direction that the trade of Newchwang can be retained. In a recent discussion of this question with the authorities it was stated that any effort

MANCHURIA

to improve the river channel at the necessary places would meet with great resistance from the farmers living close by, because the new channel which the river has broken benefits these people. Time seems to demonstrate the truth of this statement.

As an adjunct of the projected railway from Hsinmintun to Fakumen the Chinese Government contemplates the founding of a new seaport at Hulatao, in the Lien-shan district, which is to be put into direct connection with the Chinese Imperial Railway system. This port, when opened, will afford an ice-free harbour, and being 60 miles nearer to Mukden than Dalny, 100 miles nearer Mukden than Chin-wang-tao, and only 50 miles from Hsinmintun, its advantages over either Dalny or Chin-wang-tao as a port of entry and clearance are at once manifest. The new port is to be under the exclusive control of the Chinese Government, which is deemed sufficient justification for undertaking the project, in view of the fact that at present China has no ice-free harbour on the Liao-tung Gulf.

Although 1908 witnessed the readjustment of freight tariffs by the South Manchuria Railway, the rates charged at present are considered rather excessive and undoubtedly cause the Railway to lose much freight which it could handle and which is now transported by Chinese carts. This statement applies even more to the Russian line from K'uan-ch'êng-tzŭ to Harbin than to the Japanese road. The two principal shippers of foreign goods in Manchuria, the Standard Oil Company and the

TRADE OF MANCHURIA

British-American Tobacco Company, have recently decided that for short hauls of twenty-five to seventy-five miles it is cheaper and better to cart their goods across country than to pay the freight charges asked by the railways, and both kerosene and cigarettes are being transported from K'uan-ch'êng-tzũ to Harbin, a distance of 150 miles, by cart.

In the neighbourhood of Mukden (at Tienling, forty-two miles away, at Liao-yang, forty miles distant, and at Fu-shun, twenty-five miles distant) there are coal deposits of great abundance and excellent quality, some of the coal approaching the best Pennsylvania anthracite in grade. Mukden, with its 200,000 population, consumes during the long and severe winters large quantities of coal. Most of the family coal sold here is Fu-shun coal, from the railway company's own collieries, which are only twenty-five miles distant on a branch line of the South Manchuria Railway. This brittle and inferior coal is sold at \$4.80 to \$6 United States gold per ton. Nor can coal from any of the surrounding mines not under the railway's control successfully compete with the Company's output. The result is that whatever coal comes into Mukden from the independent mines comes by Chinese cart, and prices are kept up for the reason that transportation over long distances by horse carts is costly.

An understanding has been arrived at between Japan and China, whereby Japan agreed to transfer her military telegraph lines in Manchuria to China, and whereby the submarine cable connecting the

MANCHURIA

Kwang-tung Peninsula with Chefoo should become a joint undertaking between the two governments. In consideration of this transfer to China of the Japanese land lines, China agreed to pay to Japan a lump sum of money (\$25,000 United States currency) and to grant the Japanese the exclusive right to operate the lines connecting the treaty ports of An-tung, Newchwang, Liao-yang, Mukden, T'ieh-ling, and K'uan-ch'êng-tzŭ for a period of fifteen years. These lines are, however, to be used only for the exchange of telegrams from or to the places under the direct control of the Japanese telegraph system. Japan also undertakes to pay to the Chinese Government a small annual royalty on all messages forwarded over the Japanese-Manchurian telegraph lines. The length of land lines transferred under this agreement aggregates 120 miles, 103 miles of which were originally built by China, but which were seized by the Japanese military forces during the late war. Under the new arrangement the Manchurian terminal of the submarine cable at Chefoo is to be located at Dalny instead of at Port Arthur.

The Chinese Imperial telegraph system has extended its lines in several directions, the most notable extension being the new line connecting Newchwang with An-tung via Hai-cheng, Hsin-yen, Ta-ku-shan, and Ta-tung-k'ou. Recently this system reduced its schedule of charges throughout China Proper 20 per cent., as compared with former rates, while in Manchuria the reduction is to be 50 per cent.

TRADE OF MANCHURIA

The deforestation of Manchuria, which has been in progress for several hundreds of years, has left the entire country, except the mountainous regions, practically denuded of forest trees, and the demand for railway and mining lumber now threatens to rob even the mountains of their standing timber. To compensate in some measure for the country's loss in this respect, the Mukden Government is attempting to encourage the growing of forest trees and has engaged the services of a foreign forester and placed at his disposal a tract of 700 acres as a nursery for the propagation of forest trees and shrubs.

Much interest is being manifested in the subject of education, especially in the "new education" — that is, education along modern lines. The total number of schools in the province, exclusive of Mukden, is 838, employing 1,448 teachers and having enrolled 29,497 boys and 126 girls. The cost of maintenance for the year 1908 was \$310,500, or an average of \$10.49 per student. In Mukden city there are 47 schools, with 298 teachers and an enrolment of 3,773 boys and 351 girls, the cost of maintaining which for the year was \$186,300, or an average cost per pupil of \$45.17. However, since the province has a population of some 10,000,000, this total of 33,747 pupils in its schools makes the average rate of attendance less than one-half of one per cent. Although there were only 477 girl students last year, the subject of educating the girls is being widely and favourably discussed, and many

MANCHURIA

more schools will be established for them in the near future.

In addition to the schools mentioned there is in the city of Mukden a school of law devoted exclusively to the teaching of law, both Chinese and foreign. The institution is well housed in a commodious two-story brick building having accommodations for 450 students. The present enrolment is 400, with a corps of 12 instructors, of whom 4 are Japanese and the remainder Chinese who, for the most part, were educated in Japan. The text-books used are Chinese translations from European and Japanese works, and all teaching is done in the Chinese language. The school is maintained at the Government's expense, and is under the direct supervision of Government officials.

The Japanese Government maintains elementary schools for Japanese children in Dalny, Port Arthur, and Kinchou. In May, 1906, there were only 131 children in the two Japanese schools then existing at Dalny and Port Arthur. At the end of 1907 the total number at all three schools had reached 1,207, and at the end of 1908 the enrolment was 1,925. The Government has, besides, schools for Chinese children at six places — Dalny, Hsiaopingtao, Port Arthur, Sanchienpao, Kinchou, and Pitzuwo. The enrolment at the end of 1908 was 605, but this was a decided improvement over 1907, when the number reported was 326. One of the principal reasons for the apparently small attendance is that a large proportion of the Chinese, especially in the cities, con-

TRADE OF MANCHURIA

sists of men who keep their families at home in Shantung province, or other parts of China Proper. At the Chinese schools tuition is free, but at the Japanese schools a fee of 15 to 20 cents a month is collected. Besides the Government institutions, which are under Japanese principals, the Chinese maintain a number of small schools of their own, frequently in connection with their temples. The Government is planning to establish a technical school at Port Arthur, also a girls' high school and a normal school for Chinese, but as yet there are no advanced schools in the district.

There has been an appreciable increase in the population of southern Manchuria during 1908, consisting mainly of Japanese immigrants and of Chinese agriculturists from the central provinces of China. As far as the larger cities of Manchuria are concerned, there has been generally but little change in the population one way or the other. However, Fakumen's population increased 30 per cent., and that of Hsinmintun 10 per cent., but Liao-yang reports a decrease of approximately 12 per cent.

The population of the principal cities of southern Manchuria at the close of 1908 is given in the following table:

M A N C H U R I A

City.	Chinese.	Japanese.	Other.	Total.
An-tung	19,678	5,749	35	25,462
Dalny	17,561	20,515	45	38,121
Newchwang	52,000	2,396	142	54,538
Liao-yang	35,000	2,816	5	37,821
Mukden	175,000	3,777	90	178,867
T'ieh-ling	28,500	5,425	4	33,929
K'uan-ch'êng-tzŭ (Ch'ang-ch'un)	93,000	7,561	15	100,576
Kirin	125,000	500	5	125,505
Hsinmintun	35,000	105	6	35,111
Fakumen	24,000	51	3	24,054
Total	604,739	48,895	350	353,984

The net increase of the Japanese population in Manchuria for the year 1908 was 14,149, of whom 5,296 settled in the leased territory and 8,853 scattered throughout the country, mostly along the line of the South Manchuria Railway. A conservative estimate of the number of Chinese immigrants during the year would place the figure at 25,000, the majority of the newcomers being of the agricultural class, who have come to Manchuria to find permanent homes and have settled in the fertile regions surrounding Fakumen and Chengchiatun. Should the plans of the Government for the settlement of waste lands meet with success, the number of Chinese arrivals will rapidly increase.

This region of An-tung being more agricultural than mercantile in its pursuits, the wave of commercial depression which proved all but disastrous to the trade and commerce of North China during the past eighteen months has not seriously affected the trade of An-tung. The various dealers and farmers

TRADE OF MANCHURIA

report that the year was a reasonably profitable one, but complain of the curtailment of the consumer's purchasing power owing to general business stagnation and the low rate of silver exchange. Ordinarily this low rate of exchange would have created a healthy foreign market for the soil products of the district, such as lumber, beans, silk, etc., but because of widespread commercial depression prices in general were somewhat low and profits not so large as was anticipated.

However, outward appearances afford indication of prosperity. The Chinese section of An-tung has been all but rebuilt, the additions and alterations being substantial and permanent. The section between the Chinese town and the Japanese settlement now has a system of regularly laid-out streets, some of which connect, by bridges and cuttings through the Japanese dike, with the main roads of the settlement.

YA-LU VALLEY TIMBER MONOPOLY

The year 1908 witnessed the inauguration of the Sino-Japanese Ya-lu Timber Company, the establishment of which was first provided for in the Komura Agreement, signed at Peking in 1905, and made the subject of two subsequent agreements. These conventions provided for the formation of an international joint-stock company for the exploitation of timber in the Ya-lu River Valley, with a capital of \$3,000,000, to be supplied in equal proportions by the Chinese and Japanese governments,

MANCHURIA

also that after one year's time stock shares are to be sold to Japanese and Chinese investors in equal proportions in order that the concern may be owned privately, and thus relieve the two governments of the burden of management. The Company is to carry on its operations in a strip of territory 20 miles wide, along that part of the Ya-lu River between Maoershan and what is known as the "Twenty-fourth Valley," near the headwaters of the stream.

The Company is empowered to act as sole selling agent for all timber felled by Chinese either in this region or in the Hun River Valley, which in practice has resulted in the Company exercising the right of compulsory purchase and sale of all timber floated down the Ya-lu to An-tung, regardless of its origin. In other words, the new company is exercising a complete monopoly in the disposition of all the timber of the Ya-lu Valley, thus continuing the practice of the Japanese timber bureau during the past two seasons of forcing raftsmen to dispose of their timber to the Company at prices fixed by the Company itself. These prices have been better than those paid by the timber bureau mentioned, but have invariably been 10 to 15 per cent. less than the real market price of the timber. The prosperity of the entire district depends largely upon the successful marketing of the Ya-lu's splendid timber.

The feature of An-tung's commercial prosperity that gives greatest promise, however, is the assurance that reconstruction of the railway from here

TRADE OF MANCHURIA

to Mukden will be immediately undertaken and pushed to completion without delay. This entails the bridging of the Ya-lu River opposite An-tung in order that direct connection may be effected between the Japanese railways of Korea and Manchuria. When this connection is established, Tokio will have, with the exception of one short ferry, direct rail communication with Paris. The \$10,000,000 loan recently floated in London is to be devoted to the reconstruction of the An-tung-Mukden line, the final surveys for which are now being made.

The general plans sanctioned by the management of the South Manchuria Railway provide for a northern terminal at Suchiatun, a station on the main line of the South Manchuria Railway some 10 miles south of Mukden. Suchiatun is already the junction of the branch line to the Fu-shun collieries, having the necessary yards and transshipping facilities. By making Suchiatun instead of Mukden the terminal of the line the company will obviate the necessity of bridging the Hun River and at the same time will save several miles of track. The new route will not likewise deviate much from the present line, but will be approximately 20 miles shorter, the total length of the new line being 170 miles. It is likewise proposed, in order to induce passenger traffic, to preserve as much of the scenic attractiveness of the present line as engineering considerations will permit. The railway officials promise that the conversion of the line will be completed within three years. It is estimated that the

MANCHURIA

cost of reconstruction will approximate \$49,800 per mile.

The construction of the railway and the building of the Ya-lu bridge will incidentally bring considerable money into An-tung and insure a measure of prosperity.

Although timber has been and still is regarded as the most important article of An-tung's export trade, owing to the large number of men engaged in cutting, rafting, and marketing, wild silk may gain the lead if development continues through the coming years as is now promised. In 1907 the exports of raw silk and cocoons from this port amounted to 473,333 pounds and 11,060,400 pounds, respectively, while in 1908 the exports of raw silk were 1,086,400 pounds, and of cocoons 12,856,800 pounds. The total value of the silk crop of 1908 was approximately \$1,552,500, yet this figure is said by the silk merchants to afford an erroneous idea of profits because of the poor prices received. The farmers are reputed to have realised very little profit. In some instances, in fact, they are said to have sustained actual losses. The prices in 1907 for cocoons ranged from 52 to 72 cents per thousand, while during 1908 they were 50 to 56 cents per thousand. It is satisfactory to note, however, that this industry is rapidly expanding, and as the forests are cleared away still greater areas will be devoted to agriculture.

The widening of the general market for Ya-lu timber, however, together with the general advance

TRADE OF MANCHURIA

in lumber prices throughout the world, gives promise of increasing activity and prosperity in the timber trade, if the arrangement between the new Ya-lu Timber Company and the lumbermen and wood hongs proves successful. Unfortunately the immediate outlook is not very bright, the number of cutters and raftsmen having been reduced to less than one-third that of an average year.

It is inadvisable, with the meagre and unreliable information obtainable, to give a numerical estimate of the proportion of arable land devoted to poppy cultivation. It can be stated, however, that in all the districts of the Ya-lu Valley save one there is but a very small percentage of the land thus employed at the present time. Formerly from 20 to 30 per cent. of all the tillable land is said to have been devoted to the poppy. A resident missionary reports that in one magistracy there were in 1907 approximately 3,000 acres under poppy cultivation, whereas in 1908 he could not discover a single acre thus employed. It appears that the measures taken by the Chinese officials for the restriction of poppy culture and the opium habit have already produced sufficiently encouraging results to afford, in this part of China at least, a very promising earnest of what the future will bring.

A Chinese normal school was established on one of the hills back of the town. The buildings are new and commodious, and the school opened with 30 students. There is also a public elementary school with an enrolment of 143 boys.

MANCHURIA

The Chinese Imperial Telegraphs brought An-tung into connection with its service by extending a line from Newchwang via Hai-cheng, Hsin-yen, Ta-kushan, and Tat-ung-k'ou, and the An-tung Electric Light Company, a joint-stock company in which Chinese are said to hold a few shares, is operating its plant in the Japanese settlement for lighting purposes.

There seems to be good ground to hope for a steady growth of business in Dalny, when it is considered that in spite of the hard times the population increased 20 per cent., and that while imports showed only a slight gain, exports increased 60 per cent. and direct exports to Europe were made for the first time in 1908. Bank loans and deposits doubled, the value of buildings for which permits were issued was nearly twice as much as in 1907, salt production in the province and the fish catch also nearly doubled, and flourishing bean-oil and bean-cake industry at Dalny practically had its beginning in 1908.

More encouraging still is the growth of Chinese business here. The value of trade between Dalny and other Chinese ports in 1908 was twice the amount in 1907, and Chinese investments in real estate, judged by the building permits issued, were four times what they were in 1907. The number of small Chinese merchants coming here to sell their produce is growing rapidly, and, while they do not yet buy much in the province, that will probably come later. At present there are almost no stocks

TRADE OF MANCHURIA

of the principal staples kept in Dalny. As the commercial prosperity of the city depends mainly on the Chinese, signs of their increasing interest in this section seem significant, especially as they come in a time of commercial depression. However much the Chinese may work to develop other ports, the best customers for their Manchurian products are the Japanese merchants, and the best market for their beans will be, as here, where there are many Japanese. If to these facts are added the natural advantages possessed by this city with its ice-free harbour, its fine wharves, and excellent railway connections, there is surely ground to predict a great future for Dalny.

First place in the import trade of Dalny is held by goods from Japan, which were valued by the customs last year at \$6,824,440, but which Japanese figures place at \$8,429,393. This total is made up of a large variety of articles, from lumber and railway material to notions and a great part simply represents the supplies of food, clothing, furniture, etc., drawn from Japan by Japanese residents in Manchuria for their own use. Of the staple goods for the Chinese market, the most important are cotton goods and cigarettes. About 4 per cent. of the imports from Japan are goods received in Japan from other countries.

The United States is second in the import list, with \$3,762,653, according to customs figures, or about 32 per cent. This was almost entirely trade with the Japanese in Manchuria, and was made up

MANCHURIA

mainly of supplies for the South Manchuria Railway Company. The figure seems to be too small, as the value of railway supplies ordered in America and received during 1907 and 1908 was approximately \$10,409,000, of which much less than half came in during 1907. The explanation may be that entries of duty-free goods for the railway or for general consumption in the leased territory are less carefully prepared, as to details, by the consignees. The American staple articles destined for the Chinese market in Manchuria do not yet come through this port in large quantities, and those that do come by this route are almost entirely from Shanghai or Chefoo. This applies to cotton goods, kerosene, and cigarettes, and, to a certain extent, to flour. Now that the first orders for railway supplies have been filled, it seems likely that direct trade between the United States and the port of Dalny will dwindle very rapidly, for this port is off the route of the regular liners, and ships will not call here unless considerable cargo offers; but as the American goods which the Chinese want can now very easily be shipped up from Shanghai, this is not quite so serious as it might seem.

The third place among countries shipping direct to this port is held by Korea, imports from which amounted to \$619,087 according to Chinese figures, or about 5 per cent., almost all of this being rice. The greater part of the rice sold here is from Korea, and as it is both good and cheap it finds a ready market. The business is in the hands of Jap-

TRADE OF MANCHURIA

anese firms established in Korea, which maintain branches in Dalny. The United Kingdom comes fourth, imports from that country being valued at \$269,234, mostly machinery and other metal goods. To Germany is credited \$42,884 for similar articles; to Russia, \$25,820 representing kerosene; and to Hong-kong, \$24,722. The foreign goods brought in from Chinese ports were valued at \$1,133,21, but it is impossible to determine what proportion of this amount should be assigned to each of the various countries of origin. The domestic goods brought in from Chinese ports were valued at \$1,310,622.

The rails, locomotives, bridge work, and most of the cars purchased on the first orders for supplies for the South Manchuria Railway were bought in the United States and delivery was completed in 1909. Of the new purchases under this head, the most important were an order placed in Russia for some 6,600 tons of steel rails worth about \$250,000, a new electric-power outfit costing \$135,000, ordered in the United States; rails, cars, and trucks for the Dalny street railway, ordered in Germany and England and costing approximately \$277,000; and a gas-generating plant and distributing pipes, purchased in Germany and Great Britain, respectively. About \$300,000 was appropriated for this plant and equipment. Many of these articles have not yet been delivered and business in this line of goods is not ended. Inquiries have been sent by the railway company to selected manufacturers in the United States, Great Britain, and Germany for bids on 200

MANCHURIA

to 300 coal cars, and as the specifications are based on plans drawn by an American builder, the manufacturers of the United States should have an advantage in competition. Moreover, the new line for the An-tung-Mukden railway is now being surveyed and orders for rails and bridge work must be placed before long. The natural development of the road will probably result in small orders for such supplies every year, even after this first work is completed. Imports of railway materials from Japan during 1908 were valued at \$780,740, the largest items being sleepers and freight cars.

Dalny itself is not a market for cotton goods, except in a retail sense, but large quantities of cotton manufactures are forwarded from this point into the interior. Local dealers engaged in forwarding these cotton goods report that on account of the depression in the bean market in 1907 farmers did not realise on their crops as quickly and as profitably as had been hoped, and consequently their purchasing power was reduced. Moreover, the continued depreciation of silver discouraged importers from placing orders. It is said that the Japanese cotton goods syndicate, which had previously allowed its agents considerable freedom to reduce prices in order to introduce its goods, began to feel that the loss thus incurred was too heavy, and consequently insisted that prices be raised. This naturally had some effect on the sales of Japanese cottons. In the Chinese retail stores here the shirtings, sheeting, and drills are almost all of American origin, with

TRADE OF MANCHURIA

some English goods in the finer grades. In cotton flannels and narrow cotton cloth, the Japanese makes seem to be popular on account of their cheapness, while in prints Russian goods predominate.

The statistics of direct trade with foreign countries show the imports from Japan of plain grey shirtings, sheetings, drills, and T cloths, which are the most important items in the Chinese cotton-goods trade, to have amounted to 218,899 pieces, while English goods of the same nature amounted to only 6,027 pieces, and the American to 960 pieces. A little over three-fourths of the Japanese imports referred to come under the head of grey shirtings.

American shirtings, sheetings, drills, jeans, and cotton flannels brought in through Chinese ports amounted to 80,270 pieces, of which 74,281 were sheetings; while English goods, of which over two-thirds were jeans, amounted to 14,360 pieces. From Chefoo and Shanghai came also 6,906 pieces of various Japanese cottons of the classes that compete with foreign goods. The total value of Japanese goods of this kind brought in from both foreign and Chinese ports was \$420,210; of American goods, \$210,330; and of English, \$49,400. From Japan come also considerable quantities of narrow cotton goods, towels, underwear, etc. According to the Customs Returns, the cotton goods forwarded to the interior were valued at \$789,922, and included 228,640 pieces of Japanese grey shirtings, sheetings, drills, and T cloths; 66,444 pieces of American goods of the same kinds, and 11,275 of English manufac-

MANCHURIA

ture. In the American and English lists are included also jeans, which are not imported from Japan.

Comparison with 1907 is difficult. The total value of imports of cotton goods at Dalny is reported in the Japanese local statistics for 1908 as \$1,313,377, against \$1,485,531 in 1907, a slight falling off compared with even that unfavourable year; but if the Customs Returns of goods forwarded to the interior in the second half of 1907 are taken as a basis of comparison, it is found that the American goods shipped in 1908 divided by two show an increase of about 300 per cent. over the half year of 1907. Merchants also seem to regard the outlook for American goods as distinctly more hopeful now, especially with the success of the bean crop and the consequent increase of the purchasing power of the people. It seems, however, that it will be difficult to do a large business unless American merchants can bring their goods to the market in the interior and either take native products in exchange or enter into some arrangement with an export house to buy their bills. Considerable loss is involved in making remittances through the banks, as there is not yet sufficient competition to keep the rates down, and the state of the currency makes banking expensive.

Cotton yarn imported from foreign and Chinese ports amounted to only 1,076,000 pounds, of which 602,400 pounds were Indian yarn, 471,600 pounds Japanese, and the remaining 2,000 English. According to the Japanese statistics, this business showed a fair increase compared with the previous year,

TRADE OF MANCHURIA

but even now it amounts to but \$133,879 in value, as reported by the Chinese customs, though the Japanese local report places it at \$245,671.

The weekly sailings now maintained between Shanghai and Dalny undoubtedly have a favourable effect on all cotton goods trade, and it is interesting to note that a Russian merchant buying Chinese raw cotton, which on account of the European tariff can be profitably imported into Russia only by way of the Siberian railroad, finds it more advantageous to ship via Dalny and Ch'ang-ch'un than via Vladivostock, though sending by this route involves an additional transshipment at Ch'ang-ch'un. It is difficult to understand how such a long haul can be profitably made, for the total freight comes to nearly \$50 per ton, but the special kind of cotton obtained in certain parts of China seems to be in demand in Russia.

The flour business was much depressed during 1908, partly on account of the exchange and partly on account of the abundant crops in Manchuria and the consequent cheapness of native food products. A few direct shipments, amounting to about 241,000 bags, were received from America early in the year, but two of the large Japanese buyers were obliged to dispose of their holdings and most of this flour was bought up by other dealers in order to save the market, with the result that the average price of American flour during 1908 was \$1.04 per quarter sack. Some flour from the Japanese mill at T'ieh-ling was brought down during the year, and was

MANCHURIA

offered at prices about $2\frac{1}{2}$ cents less per bag than the American, but this difference in price was not enough to make up for the difference in quality with the Chinese buyers. In October the market for American flour improved on account of the rise of silver exchange, but one of the principal dealers complains that, though there is some demand, he cannot order in sufficient quantities to secure a direct steamer. As a result, about 127,000 bags of American flour were shipped to Dalny from Japan during the year, and about 80,000 from Shanghai and Chefoo. According to the customs statistics, the shipments of American flour from foreign countries during 1908 were valued at \$367,327, and from Chinese ports at \$80,086, or \$447,413 in all, whereas in 1907 the Japanese figures gave \$715,240 as the total value of flour imports.

Kerosene imports fell off about 30 per cent., compared with 1907, but this was largely due to the fact that early in 1907 large shipments were made to the interior through Dalny on account of there being no customs duties collected at this port until July of that year. In general, the condition of the business, which is still merely local, was not bad. About 88,600 cases of American oil were received during the year, of which 4,100 were from foreign countries (probably Japan), while 84,500 were from Chefoo and Shanghai; and, according to the customs, 14,745 cases were sent into the interior from Dalny. Official sources give the amount of Sumatra oil imported as only 7,000 cases, all coming from

TRADE OF MANCHURIA

Shanghai. The actual quantity, however, was 20,500 cases. In 1908 the average price of American kerosene of the grade known as "brilliant" was \$1.04 per case. Russian oil is commonly quoted about 14 cents per case lower, the second American grade about 7 cents below the Russian, and the better grade of Sumatra is about 7 cents cheaper than the second grade of the American oil. American oil continues to be the most popular.

Neither the American nor the Russian company is prepared to import on a large scale, and cannot be ready to do so much before next year. The American company has completed its agreements with the Government and the railway company, and will shortly begin work on its plant. The Sumatra oil interests are making Newchwang their importing point and are preparing here for merely the local business. Nothing more is heard of the proposed Japanese refinery for which land was granted two years ago, and it is doubtful if the capitalists interested will even build a storage plant in the near future, as there seems little chance of profit in view of the competition already existing. With the American and Russian companies making their headquarters here, however, Dalny will no doubt be the principal oil depot for Manchuria. It is likely that profitable junk trade in kerosene will grow up when the bulk plants are completed.

During 1908, 2,500,000 feet of Oregon pine were imported by a Japanese firm, principally on orders from the railway company and local dealers. The

MANCHURIA

lumber was in logs from 20 to 72 feet long (lengths from 22 to 55 feet predominating) and varied in size from one foot to two feet two inches in the cross section, the greater part being about one foot eight inches. According to local contractors, this is the best way of importing at present, as the sizes of lumber used here vary so greatly that it is cheaper for builders to buy the logs and saw them up to meet their own requirements. This pine was sold to dealers in large quantities at \$32.37 per 1,000 superficial feet, while retail lots sold for about \$40. The customs statistics place the imports of soft wood from foreign countries at 23,920,746 superficial feet. Besides the imports from America, which were not all credited in the customs returns, Korea supplied 1,072,645 superficial feet, and the balance of the foreign softwood imports came from Japan. From Chinese ports (Cheefoo, An-tung, and Tientsin) came 54,209 superficial feet. The Japanese and Ya-lu pine of medium quality sold in 1907 and at the beginning of 1908 for about \$27.50 per 1,000 feet, but the price fell to \$17.50 toward the latter part of the year, and most of the lumber merchants suffered serious loss on this account. Hard woods imported from abroad amounted to 19,285 cubic feet, all being from Japan.

Russian builders' hardware continues popular, as almost anything required can easily be bought in Harbin. Two or three American salesmen have been there, and there has been considerable interest in their goods, but few sales, because of the difficult

TRADE OF MANCHURIA

terms and the length of time required to fill orders. If American goods could be obtained quickly, their substitution would often be approved, but there is usually no time to order from America. It is obviously impossible for American manufacturers to keep stocks in every place as small as Dalny is now, but if a good supply of the principal articles, such as hinges, bolts, latches, and locks could be kept at a central point like Shanghai, and this fact made known to the trade throughout this section, the result would doubtless be satisfactory. Hardware imported from foreign countries in 1908 was valued at \$212,635.

The imports of cigars and cigarettes increased about 160 per cent. during 1908. The British-American cigarettes, of which the cheapest brands are now practically Chinese manufactures, are still competing with the products of the Japanese monopoly bureau and the Russian cigarettes, and there are seen also various Chinese, Philippine, and Turkish brands. Manilla cigars are sold everywhere, and as they are not subject to any taxation whatever the business is likely to increase. European cigars are sold, but in small quantities compared with the Manilla cigars. Japanese local statistics placed the value of cigars and cigarettes imported in 1908 at \$650,733, this figure including those of the coasting trade, while statistics published in Japan give the exports of Japanese cigarettes to this district during the twelve months ending October 31, 1908, as 412,675,000, valued at \$324,270.

MANCHURIA

A factory for the manufacture of cigarettes, under the control of the Japanese Government monopoly, has just been opened at Newchwang.

A building 500 by 240 feet has been erected at a cost of about \$25,000 gold, and two power engines have been installed. The plant is located in the so-called Japanese concession. The machinery is being imported from Japan. It is proposed to employ 150 to 200 Japanese at varying wages for the positions requiring more or less skilled workmen, and about 250 Chinese boys for the unskilled labour at three cents per day each.

Only imported tobacco will be used, principally Japanese. By so doing duty will be paid at the rate of 0.80 Haikwan tael per picul on leaf tobacco (\$0.375 United States currency per 100 lbs.); 0.95 haikwan tael per picul on prepared tobacco (\$0.445 per 100 lbs.), and 0.125 Haikwan tael (\$0.078) per 100,000 sheets, not exceeding two by four inches, on cigarette paper, instead of the duty on cigarettes amounting to 0.50 Haikwan tael (\$0.312) per 1,000 on first quality of value exceeding 4.50 Haikwan tael (\$2.81) per 1,000, and 0.09 Haikwan tael (\$0.056) per 1,000 on second quality of a value less than 4.50 Haikwan tael (\$2.81) per 1,000.

This new departure evidently marks the determination of the Japanese to have a share in the cigarette trade in Manchuria, which has heretofore been monopolised by the British-American Tobacco Company. Under the name of the British Cigarette Company, this firm has for some years been manu-

TRADE OF MANCHURIA

facturing cheap cigarettes for the China market in their factory at Pootung, Shanghai, so that the Japanese in opening a factory here are following their lead.

The value of goods sent to foreign and Chinese ports from Dalny in 1908, exclusive of re-exports, was over 60 per cent. greater than in 1907, in spite of the fact that the price of beans, the principal staple, fell from about \$2.05 United States currency in 1907 to an average of about 95 cents per picul (133 $\frac{1}{3}$ pounds) in November and December of 1908. The average price for the whole year, however, was \$1.326 per picul, and for bean-cake about 54 $\frac{1}{2}$ cents per cake of 61 $\frac{1}{3}$ pounds. During the December quarter of 1908 the quantity of beans and bean-cake exported was more than twice that for the corresponding period of 1907, and during the month of January, 1909, the amount brought down by train was three times the amount for January, 1907. The total exports for 1908 of beans and bean-cake amounted to 417,516 tons, against 295,681 tons the previous year. Though many merchants still buy in the interior, a flourishing bean exchange has grown up at Dalny during the year, where large stocks can be purchased.

A very important result of the abundant bean crop, the improved transportation, and the low price of beans has been the beginning of a direct export business from Dalny to Europe. Before the close of 1908, 13,000 tons had been shipped to England, and since January 1, 1909, three more large cargoes

MANCHURIA

have been sent to Europe, while a number of Shanghai and London merchants have sent representatives here to buy beans. There have been several inquiries for beans, bean-cake, and bean-oil from the United States, but so far as can be learned no business has yet resulted. While Manchurian beans and their products will probably compete with American agricultural products in Europe, it seems hopeless to expect any great increase in the purchasing power of Manchuria unless a wider market for its products can be found than could hitherto be secured; and with the increasing prosperity of the country a correspondingly greater demand should arise for the American staples, which already enjoy such a good reputation among the Chinese.

Bean-oil exports amounted to 5,563,600 pounds, of which all but 775,467 pounds went to Chinese ports, the average price of the oil being a little less than \$4.17 per 100 Chinese kin (116 $\frac{2}{3}$ pounds).

Exports of raw wild silk during 1908 are valued in the local Japanese statistics at \$1,777,421, almost six times as much as in 1907. The customs give the direct exports to foreign countries as only \$36,633, the greater part of the output being sent to Chefoo and Shanghai. A considerable quantity of wild silk is imported into the United States, and there seems no good reason why it should not be shipped directly from Dalny, thus saving the additional handling and commissions in Chefoo or Shanghai.

Coal seems destined to become an important item among the exports, but the business is still

TRADE OF MANCHURIA

in an experimental stage. In 1908 shipments to foreign countries amounted to 4,686 long tons. Already the South Manchuria Railway Company has a contract for furnishing coal to the mail steamers of the Osaka Shosen Kaisha, which come here twice a week from Osaka and Kobe. The price has not been made public, but it would seem to be not far from \$2.75 to \$3 per ton delivered on board, and at this low cost it is said to be quite satisfactory.

With the exception of \$239,828, representing the customs valuation of beans shipped to England, and \$1,209 for exports to Korea, the entire foreign export trade of Dalny is with Japan, the total value of exports to that country being \$4,574,057. Only one item was declared for export to the United States in 1908, \$148.45 worth of household and personal effects.

The shipping of the port showed a fair increase, the arrivals at Dalny having been 1,375 steamers registering 1,147,287 net tons, against 1,272 registering 957,963 tons in 1907. There was thus an average of 3.7 steamers with an aggregate tonnage of 3,143 net entering the port daily. Ordinary sailing vessels arriving numbered only 72, with a total of 3,348 tons net register, all being Japanese. Shipping registered in the Port Arthur station included 190 steamers of 66,312 net tons, and six sailing vessels of 657 tons. Of the steamship tonnage, about 80 per cent. was under the Japanese and about 15 per cent. under the British flag. No American ships touched at the port, but 25 steamers

MANCHURIA

arrived from the United States—16 from New York with supplies for the railway company, six from Seattle, two from Tacoma, and one from Portland, the cargo of the last three being flour and lumber. Until the bean shipments to Europe began, steamers carrying cargo outward were all bound for Asiatic ports. The Chinese junk trade made good progress, for while the arrivals reported in 1907 were only 1,088, during 1908 there entered at the harbour office 2,758 junks of 36,879 tons.

While steamers from the United States were more numerous in 1908 than those from Great Britain, they were so irregular that merchants could not count on them very far in advance; and, now that most of the railway supplies have been delivered, steamers from New York are becoming few in number, while the depressed condition of the flour market has resulted in the interruption of direct connections with the Pacific coast. On the other hand, a British company is maintaining a fairly regular monthly freight service to Dalny from Liverpool.

British steamers carried more than \$12,000,000 of the total trade during the year, while Japanese steamers led in the export trade to foreign countries, which trade consisted principally of beans and bean-cake shipped to Japan for use as a fertiliser.

As regards freight rates, American manufacturers appear to have been, thus far at least, on an equality with their competitors in Europe, and at an advantage where a direct steamer could be secured.

TRADE OF MANCHURIA

The following schedule of freight rates from New York to Dalny covers the more important items of cargo between the two countries:

Articles.	Rate.	Articles.	Rate.
Agricultural implements . ton	\$7.896	Galvanised-iron sheets . ton	\$6.075
Boilers and parts when shipped separately . . ton .	7.896	General merchandise . . . do.	9.111
Bolts and nuts do.	6.075	Hardware, ordinary build- ers' do.	9.111
Cast-iron water pipe . . . do.	6.075	Lubricating oil do.	7.290
Cotton knit underwear . do.	6.681	Machinery do.	9.720
Cotton piece goods:		Nails in kegs . . 100 pounds .	.250
In bales . . . 100 pounds .	.625	Steel tubes ton .	6.075
In cases ton .	7.896	Wire, plain . . . 100 pounds .	.250

These charges are the same as those to Kobe and Yokohama. On cargo to be transshipped at the former port an additional \$3.645 per ton is collected to cover the transshipping charges. The ton is either twenty English hundred weight (2,240 pounds) or forty cubic feet, at the steamer's option, except where otherwise stated.

Sea connections with Japan are excellent as far as freight is concerned, though there are no large passenger ships calling here. The Osaka Shosen Kaisha continues its regular service between Osaka and Kobe and this port, with two sailings a week, for which it receives a subsidy of \$69,720 per annum; the Nippon Yusen Kaisha, under contract with the Japanese army and navy, respectively, has operated fortnightly services from Kobe via Ujina to Dalny, and from Nagasaki and Sasebo to Dalny and Port Arthur, carrying both private and Government

MANCHURIA

freight and passengers; and half-a-dozen lines of this and other companies make Dalny either their terminus or a port of call. In addition, there are Japanese tramp steamers continually entering and departing.

In August, 1908, the South Manchuria Railway Company began a weekly freight and passenger service between Dalny and Shanghai, and while little business offered at first, both the number of passengers and the freight tonnage seem to be steadily increasing, as the railway company is making special efforts to develop this line by selling through tickets and by offering through bills of lading to interior stations at moderate rates.

The trade to South China ports continues in the hands of two leading British coasting lines, whose business has greatly increased of late, so that they have had as many as eight ships in port at one time loading cargo or waiting for berths, and one of the firms has decided to open an office in Dalny.

“The time has come,” says Consul Frank D. Carpenter, “when the United States should push its trade in Manchuria. The people are just beginning to know foreign goods and buy them, and from now on there will be a great increase in the native consumption. All sorts of farming implements will be needed for the development of this great agricultural empire, and our ploughs should be in great demand. The Germans are already selling cheap imitations of American tools around Harbin. They get \$25 for a plough which could be easily landed on the ground and sold at a profit of \$10 or \$12.

TRADE OF MANCHURIA

“As the wheat lands are developed reapers will be needed, and for the large Government farms thrashers and steam engines. A British firm recently sold four large Howard steam ploughs, shipping them north from Newchwang; the board of agriculture at Mukden has on its experimental farm American reapers, harrows, harvesters, and ploughs.

“A large part of the flour milling machinery already in use is of American make, and the rolling stock of most of the railways is American. When the South Manchurian railroad was reconstructed the Japanese gave us one order which amounted to about 60,000 tons. It was for steel rails and bridging material. At the same time over 2,000 of our freight cars, 200 locomotives, and something like 200 other cars were imported.

“The new Pullmans, which are being used on the southern end of the Trans-Siberian Railroad are by far the finest sleeping cars of all Asia, and there will be a demand for similar material on the new roads. One of these will be the line to Kirin, and another, the rebuilding of the military road which now goes from Mukden to the Ya-lu River and connects with the Korean system at An-tung.

“To-day our chief exports to Manchuria, outside of railway materials, are cotton, kerosene, and tobacco. The Manchurians use about \$6,000,000 worth of cotton sheeting, every year.”

IN AND ABOUT MANCHURIA A RECORD
OF TRAVEL

BY ALEXANDER HOSIE

CHAPTER VIII

A JOURNEY INTO CENTRAL MANCHURIA

ON the 2nd January, 1896, my little caravan passed through the gates of the British Consulate at Newchwang bound northwards. The town of Niu-chuang, where one of the very few fierce struggles between the Japanese and Chinese during the late war took place, lies thirty miles inland, and the fact that the port and this inland town are indiscriminately called Newchwang gave rise to considerable confusion as to the military operations during the winter of 1894-95. In the interior of Manchuria the port is spoken of as Ying-tzŭ, or more generally Ying-kow; but as outside Manchuria it is known only as Newchwang I shall continue to name it so, and always refer to the inland town as Niu-chuang. The caravan consisted of four carts — one for Lieutenant Quayle, R.N., of H.M.S. *Rattler*, who was good enough to be my companion; one for my Chinese writer; one for provisions; and the fourth for myself. In addition to these we had three ponies to vary the monotony of cart travelling; but the weather was so cold that we rarely summoned up courage to ride. An official messenger, a cook, a horse-boy, my writer's servant, the four

MANCHURIA

carters, and twelve mules and ponies completed the caravan. We were provisioned for a month, and provided with fur-lined clothing and boots and fur rugs to enable us to withstand the rigours of a Manchurian winter. These precautions were very necessary, for during the journey we experienced a temperature of 34° below zero, or 66° of frost. Mr. Quayle had a sextant, with the usual accompaniments, and a fowling-piece which on the only occasion on which it was really required — to resist an attack by mounted robbers — could not be unearthed from its case, the lock being jammed by the jolting of the cart in which it was stowed away, and we each carried a revolver, and last, but not least, I had packed away in my cart an old battered iron despatch box — the trusty companion of my travels in Western China — filled with the more peaceful munitions of travel — broken silver ingots of various sizes, the only universal currency excepting copper cash in China.

As readers of this book may not be familiar with a Chinese passenger cart — and in this they are extremely fortunate — I may as well give a brief description of it and of the method of travel. Two stout planks of elm are joined together by cross-pieces of the same wood, the shafts measuring four feet ten inches long and two feet ten inches apart. Behind the shafts comes the driver's seat, some seventeen inches wide, extending across the cart and forming part of the bottom, which runs backwards for four feet two inches and is followed by a

TEMPORARY STORAGE OF THE COFFINS OF DEAD CHINESE
AWAITING TRANSPORTATION TO THE ORIGINAL
HOMES OF THE DECEASED

CENTRAL MANCHURIA

framework, twenty-one inches long, utilised for the stowage of baggage. The part between the driver's seat and the rear framework is covered with lattice woodwork arched at the top and about three feet eight inches high, and over the whole of the latter is spread blue native cloth, the interior in winter being lined with cheap fur. In front there is a curtain which may be raised or closed at pleasure, with a small pane of glass in the centre, and there is a window of similar dimensions in each side of the cart. Firmly attached to the bottom is a massive axle-tree and two wheels, four feet in diameter, each with sixteen spokes, kept in position by steel linch-pins. The tire, which is of iron half an inch thick, consists of eight pieces eighteen inches long and frequently so knotted as to resemble a cog-wheel nailed on to the rim, which is one and a half inches wide. The cart, therefore, has no springs, and the jolting and bumping can be more readily imagined than described. To obviate this as much as possible cushions and mattresses are utilised; but even these get displaced and require constant attention. I found that I had a low easy arm-chair, which exactly fitted the breadth of the interior of the cart, and on this chair I sat for the greater part of the twenty-three days and nights of travel. Even this had its drawbacks, for, as I have not the advantage of being short, my feet projected on to the driver's seat, and, although cased in fur-lined boots and covered with fur and other rugs, they were always excessively cold during the night and early morning. The very

MANCHURIA

first morning the driver happened by accident to sit on one of my feet, and, finding that he imparted warmth, I edged in the other, and not unfrequently afterwards did I adopt the same tactics. Owing to the number of garments which he wore, he was not inconvenienced — at least he made no complaint, and I was a decided gainer. Another discomfort was from our moustaches, which were frozen at least a dozen times daily from start till sunrise, as well as towards sunset. The process of thawing the lumps of ice which clung to them was very painful, and, if I tried to avoid the cold by burying my face in my fur coat, I found that my moustache was invariably frozen to the fur collar. Better the ice than this! I am giving a few of the discomforts now, and I am sorry to say that I cannot mention any comforts to counterbalance them, and this for a very simple reason — there were none!

The great trade highway from Newchwang to Central and Northern Manchuria passes through the inland town of Niu-chuang, and thence goes north-east to Liao-yang Chou and onwards to Mukden or Shên-yang, the capital of the Southern province of Manchuria. It does not touch Hai-ch'êng; but, as that district city played a very important part in the war between China and Japan, I determined to visit it on my way to Kirin. On the ten miles of the highway between the port and Shih-ch'iao-tzŭ (Stone Bridge), where the branch road leads to Hai-ch'êng, we saw nothing of the immense traffic of which I shall have to speak hereafter, for

CENTRAL MANCHURIA

traffic in Manchuria is conducted on peculiar lines, the caravans of carts starting daily at any hour from two to four o'clock in the morning, and reaching their destination (a distance of about thirty miles) before nightfall. The caravans which had started south on the same day as ourselves had not reached Shih-ch'iao-tzŭ, and such as had started the previous morning had taken good care to reach Newchwang the same evening. As I shall have occasion to mention hereafter, accidents may retard a number of caravans in company, and delay their arrival at their proposed destination; and this is well provided for by solid inns or, rather, caravansaries — walled enclosures with buildings along the sides, and large compounds in the centre for the caravans — dotting the whole line of the highroads on which trade is conducted. There was a little local trade, and in the bright moonlight I noticed a number of carts bringing in the daily supply of firewood for the consumption of the port. This consists of millet stalks piled high in carts which come into Newchwang every morning and take up their position on the market-place adjoining, and to the west of, the Consulate, where the loads are disposed of and then distributed all over the town. I am loath to leave these millet stalks without a few more words regarding them. They are a very important factor in the trade of Manchuria, and deserve more than a passing notice. The most valuable use to which they are put is the manufacture of coarse mats of various sizes and shapes, according to the purpose for which

MANCHURIA

they are intended. What must strike every traveller in Manchuria is the matting which rises high around every large cart bringing produce from the interior, and which contains the loose loads of beans and millet. It lines the bottom of the cart, encircles and covers the contents, and keeps them firmly in position. If he does not observe this, he will at least not fail to notice the mat spread on the stove bed in the Chinese inn in which he has to pass the night. I venture to say that, if he happens to be travelling in the hot weather, he will examine this mat very carefully, and, if he is a wise man, he will have it taken up, well shaken, dusted, and cleaned before he ventures to seek repose. The finer mats are woven of reeds also grown in Manchuria. But I am wandering from the point, which is, that these mats are woven by hand from the outer sheaths of millet stalks. The stalks are also used for firewood, and, especially in the Fêng-t'ien province, for fencing houses and compounds. They are also largely used in house building; stalks are woven together and plastered with mud to form walls and roofs. These are the poorer houses in the country. Large stacks of them may be seen in every farmyard, shaped exactly like peat-stacks in Scotland.

From Shih-ch'iao-tzŭ the road runs east by north over flat country to Hai-ch'êng, and the farther we travelled the nearer we approached the low range of hills which runs north from the Liaotung Peninsula. Clumps of trees, for the most part willows, elms, and firs, marked the villages and

CENTRAL MANCHURIA

graveyards, and the magnificent fields — a contrast to the cultivated patches of land in Central and Southern China — were one mass of drills, from which protruded the stubble of the various millets. These drills looked exceedingly neat and beautifully ploughed; but when crossed, as they often were, by cart to make a short cut or to avoid a bad part of the road, words fail me to express the disagreeable sensations experienced. Between Shih-ch'iao-tzŭ and Hai-ch'êng we passed through the village of Kan-wang-chai, the scene of the battle of 19th December, 1894, where the Japanese casualties were exceptionally heavy. Had the Chinese, who were posted behind the mud walls of the village, been able to use their guns there would undoubtedly have been still greater slaughter, for the approach from Hai-ch'êng, whence the latter came to the attack, is an exposed flat without any cover whatever. But the Chinese could not shoot, and retired in an undignified manner on Niu-chuang. The city of Hai-ch'êng is admirably adapted for defence, and the Japanese, who entered it by the south gate without any serious opposition on the forenoon of the 13th December, 1894, and evacuated it on the 30th November, 1895, took eager advantage of its natural environments to make it impregnable — at least against the Chinese. Low hills are found at short distances outside the four walls of the city, and these as well as an eminence — supposed to be an old Korean fort — in the south-eastern quarter of the town itself were all fortified against possible

MANCHURIA

attempts to reoccupy the position. When we crossed the plain to the west of the town, which we entered by the west gate, we came across from time to time remnants of earthworks which had been thrown up by the Japanese, and the fortifications which had been erected on the old Korean fort had evidently been destroyed by gun-cotton or dynamite. Of course all the guns had been removed at the time of the evacuation.

At Pa-li-ho-tzŭ, a hamlet some three miles to the south-west of Hai-ch'êng, and on the left bank of a stream which flows into the Hai-ch'êng River, we endeavoured to satisfy the cravings of hunger; but the innkeeper told us that he had lost everything at the hands of Chinese soldiers during the war, and had been unable to resume business. There was no help for it but to hurry on to Hai-ch'êng, which we reached at 3.30 P.M., having struck the ice-bound river opposite the west wall of the city. This river, which flows along the south, sweeps north-wards along the western wall past the west gate, and flows west by north into the Hun Ho, an eastern branch of the Liao River, passing a little to the north of the inland town of Niu-chuang. Our wants were abundantly satisfied at the Mission House of the United Presbyterian Church of Scotland, where we passed the night on our way through the city. I noticed that great destruction had taken place, and it is safe to say that in every city occupied by the Japanese the same tale could be told, for houses foolishly deserted by their owners on the approach of the

CENTRAL MANCHURIA

enemy were looked upon as legitimate spoil by the Chinese who remained.

I observed on this, the first stage of our journey, that water for household and other purposes was obtained from wells, and that the supply was drawn either by a windlass fixed over the mouth of the well or by the method, so common in Southern China, especially in the neighbourhood of Amoy, of a lever working on a pivot erected near the well, and having attached to the thin end a rope and a bucket and to the heavier end a weight of stone or iron. This latter is in fact the *shadouf* of Egypt, the *lat* of Northern and the *picottah* of Southern India. The magistrate of Hai-ch'êng was absent; but, in accordance with a request sent to the Yamên, the north gate of the city was to be opened for us at four o'clock next morning, when we left for Liao-yang Chou, the next stage of our journey. Of course the warders were asleep when we reached the gate, and a quarter of an hour's delay was the result. I did not blame them for preferring their beds to a bitterly cold atmosphere, but my followers grumbled loudly because they were less comfortable. It is exceedingly difficult to make reliable observations in the moonlight: a bank of snow by the roadside is magnified into the snowclad base of a hill represented by the darkness beyond, while a bed of snow in a valley is mistaken for a river. When daylight appeared, however, I found that low hills jutted into the plain from the range to the east, rendering the road, which goes north by east, less level than to the west of

MANCHURIA

Hai-ch'êng. Here and there it lies between low embankments. In every village through which we passed, traces, in the shape of ruined houses, were visible of the devastation caused by the Chinese forces which were massed during the war between Hai-ch'êng and Liao-yang to prevent the advance of the Japanese to Mukden. On nearing the hamlet of T'ang-chih, or, as it is more generally called, T'ang-kang-tzŭ, eighteen miles from Hai-ch'êng, low hills break into the plain from the east. They were lightly clad with snow, and a small temple presides over the few mud-houses which constitute the hamlet. Here are situated the famous sulphur, I should rather say mineral, springs of the province. Some care has been taken of them, for three stone baths have been constructed and a house built over them, and outside there is a large circular bath for the general public. The water, which was tepid, was several feet deep, and there was a whitish efflorescence of sulphur on the encircling stones and withered herbage. The air was laden with an odour far from pleasant. I was induced by a friend who was taking the waters internally and externally to join him in his morning draught; but I regretted my imprudence, and the companion of my journey, who declined the proffered cup, had his knowledge increased by my self-sacrifice. He acquired the knowledge; but I flatter myself that my knowledge was more perfect, gained as it was through pain. A few miles to the east of T'ang-kang-tzŭ are the Ch'ien Shan, a cluster of hills culminating in peaks,

CENTRAL MANCHURIA

none appearing to rise higher than a thousand feet. The name means "the Thousand Hills," and there is a legend that the original number was 999, but, as this idyllic odd number was unsatisfactory, an artificial hill was added to make the thousand. I was surprised to hear it, for the Chinese are very fond of odd numbers, but to have to say *Chiu pai shih chiu shan* (the 999 Hills) every time reference had to be made to them may have settled the necessity of adding a hill, and thereby curtailing the name of two characters. They looked very inviting even in winter, and I am informed by fellow-countrymen who have visited them that in spring they are clad with a great variety of beautiful flowers. There are temples, too, available for residence, and at one of these, Lung-ch'üan Ssü ("the Temple of the Dragon Spring"), there is an unceasing supply of crystal water. Four miles north by east of T'ang-kang-tzŭ is the village of An-shan-chan, the most northerly point reached by the Japanese during their invasion of Manchuria. Under pretence of advancing on Liao-yang from Hai-ch'êng they pushed forward as far as An-shan-chan, and then turned south-west to Niu-chuang, leaving the Chinese, who had fallen back on Sha-ho-tzŭ and Liao-yang, utterly bewildered as to their movements. The village, which is situated at the north end of a short valley near the right bank of a small stream flowing west by north to the eastern branch of the Liao River, consists of a long street in ruins, and at the north end a square, high walled enclosure, with a few

MANCHURIA

houses inside, evidently a dilapidated camp. It derives its name from a hill immediately to the east of it — An-shan, or “Saddle Hill,” so called from a depression in its centre. To the west a few low hills of bare granite are to be seen. If Saddle Hill had been well fortified a handful of brave men who knew their duty could have held this road against an overwhelming force. North of An-shan-chan the country opens out into a broad level plain, and following this for ten miles we struck Sha-ho-tzŭ, a bustling town built on both banks of another tributary of the Eastern Liao. The day was well advanced when we crossed the frozen stream, and we had to push on to reach our destination for the night, still eleven miles distant. Six miles from Sha-ho-tzŭ a range of low hills (Shou Shan) creeps into the plain from the east, and separates it from the Liao-yang plain. On the low pass there were traces of earthworks which had been thrown up during the war, and to all appearances guns had been mounted here. Darkness was setting in as we passed through the large village of Pai-li-chuang, and the carters were unwilling to go on; but I knew that comfortable quarters awaited us at the mission station within the city walls, where we were kindly welcomed and hospitably entertained by friends at 7.30 P.M. We were thus fifteen and a quarter hours on the road from Hai-ch'êng to Liao-yang, and if two hours be deducted for rest and refreshment, thirteen hours' actual travelling time remains. The distance covered was forty-four and one-third miles,

CHINESE BUILDING UTILISED AS RUSSIAN OFFICERS'
QUARTERS AT NU-CHWANG

CENTRAL MANCHURIA

and this agrees pretty closely with what we afterwards discovered, namely, that the average speed of a cart is ten *li*, or three and a third miles an hour. Liao-yang, at one time the capital of Liao-tung, is a city with many historical associations, but into these I do not enter, for this chapter is intended to be a record of travel and nothing more. It is surrounded by a high wall of stone and brick, with a gate in each of its four sides. There is only one low eminence within the walls, and that is occupied by the Treasury. The population is estimated at 50,000. It is a great centre for distilling the native spirit called *samshu*. The neighbourhood is famous for its fruits, which include pears, grapes, peaches, and cherries. The country is fairly well wooded, the willow, pine, and elm predominating, and in the bare branches of the latter bunches of mistletoe were growing. We did not leave the North Gate of Liao-yang till 10 A.M. next morning, the 4th of January, being somewhat fatigued by our long journey the previous day. On our way to the gate we noticed the lofty pagoda, which lies outside the north-west angle of the city walls. Three roads, known as the west, middle, and east roads respectively, lead from Liao-yang to Mukden, the capital of the Southern province of Fêng-t'ien. We selected the middle road, and, after covering a little less than three miles, struck the left bank of the T'ai-tzŭ Ho. This stream, also called the Ch'a Ho, or Erh-tao Ho (Two Branch River), rises in the hills near the Eastern Palisade, flows west by south for some fifty miles,

MANCHURIA

then west by north to the north-east angle of the walls of Liao-yang, where it turns north and west to join the Eastern Liao. It bifurcates on nearing the city, and again reunites to the north-west of Liao-yang at a place called Huang-lin-tzŭ. A distance of about a thousand yards separates their shingle beds, with wooden bridges thrown over them and layers of millet stalks spread on the top to form the roadway. The two branches were of course frozen and easily fordable on the ice. North of Liao-yang the range of hills to the east which we had in sight since starting recedes to a greater distance, leaving an immense agricultural district, dotted with farmhouses, embowered in trees, which also mark the position of graveyards with their mud, cone-shaped mounds. Between Liao-yang and Hsiao-yen-t'ai, where, owing to our late start, we were obliged to spend the night, we met several large caravans with beans, tobacco, *Abutilon* hemp (the fibre of *Abutilon avicennae*, Gaertn.) and frozen pigs lashed in every possible position around the laden carts. These pigs, which were all scraped and dressed, were usually of large size, weighing as much as 200 to 300 lb. apiece. They are fed in the province of Kirin on millet and the refuse of distilleries, killed in winter, and brought down from the interior for consumption during the cold weather. As it would be too expensive to bring the millet itself, it is converted into spirits and pork, which find a ready sale everywhere. A single caravan often numbers as many as twenty large carts,

CENTRAL MANCHURIA

each with a team of seven animals. In the best caravans, that is those which go into the provinces of Kirin and Hei-lung-chiang and into Mongolia, a team usually consists of a pony in the shafts and six trailing mules three abreast. In the case of caravans or carts going shorter distances, teams are all ponies, mixed mules and ponies, or a mixture of mules, ponies, donkeys, or even oxen.

Twenty miles still separated us from Mukden, the capital of the province, and at 3.45 A.M. on the 5th of January we proceeded north by east over the frozen fields, crossing drills and taking the mud boundary dykes at a canter. After covering thirteen miles we entered the village of Pai-t'a-p'u, where the middle and west roads unite. As the name implies, the village has a pagoda visible at some distance in this flat country. Four miles beyond we struck the left bank of the frozen Hun Ho, whose pebbly bed is of very considerable breadth. In the open season the Hun Ho is not navigable as far as Mukden: junks of any draught do not ascend beyond a distance of ten miles from the capital. There are four Lama monuments, one outside each of the four angles of the city. We passed the Nan T'a (Southern Pagoda) on our right two miles from the river, and soon after struck the southern suburb, which we skirted eastward to the Scotch Mission Station, which we reached at 11 A.M., and where we were warmly welcomed and spent the rest of the day and night. A small stream, now of course frozen, flows along the southern suburb, which is very extensive,

MANCHURIA

and its bed contains numerous springs of fine clear water. As my business was urgent, we made no stay at Mukden, but hurried on next morning towards Kirin. On our return, however, we spent the 4th of February in the capital of Fêng-t'ien, and I may here insert a brief description of it. It lies some 320 feet above sea level, and its lofty crenelated brick walls, with eight towering gateways and the usual buttresses, enclose a square mile of ground covered with one-storied brick houses. There is also a suburb surrounded by a mud wall. The main streets, which lead to the eight gates, are wide, with narrow side streets and lanes. Except for its size, one might readily imagine oneself back in Peking, and the resemblance extends even to the filth. Nurhachu, the founder of the Manchu Dynasty, shifted his capital from Liao-yang to Mukden in 1625, and in 1631, during the reign of his fourth son and successor, T'ai Tsung, the present wall and Imperial Palace were built. The latter we had the opportunity of passing through, as, on arrival at the walls of the forbidden city, we found a gate open and naturally entered. It was small and had an aged and deserted look about it, but was in a fair state of preservation. The roofs of the palace and pavilions attached to it were of yellow and blue tiles. We traversed the main streets, crowded with country people making their purchases for the China New Year; visited a gun factory, where sporting matchlocks were being turned out at \$4 apiece; proceeded outside the East Gate to the handsome church of

CENTRAL MANCHURIA

the United Presbyterian Church of Scotland, and in the afternoon walked to the Temple of Earth — a walled oblong piece of land surrounded by a brick wall, now doorless, outside the East wall — and to the tomb of the Chinese statesman Wên Hsiang, who, originally a table-boy, was educated by his master, married his daughter, and rose to be a member of the Grand Secretariat, President of several of the Six Boards, and a member of the Tsungli Yamên. He died on the 26th of May, 1876, and was buried in the beautiful little graveyard outside his native city. The remains of the father-in-law lie a little to the east of his protégé's tomb. We also visited the wards of Dr. Christie's Hospital, where excellent work is being done for suffering humanity, and where a number of students are being taught medicine and surgery. In 1893 Dr. Christie had 539 in-patients, and performed 954 operations, of which 914 were cured, 36 improved, three not improved, and only one died.

At 5.30 A.M. on the 6th of January we left Mukden to make the district city of T'ieh-ling before nightfall, but we only succeeded in covering thirty miles, and had to put up for the night at the village of Fan-chia-t'un, which lies pleasantly situated at the base of hills jutting in from the receding eastern range. The country north of Mukden is well wooded with elm, willow, and pine, and carts laden with fir branches were entering the capital as we left it. Mistletoe was growing luxuriantly on the elms. Thirteen miles from Mukden we crossed a stream-

MANCHURIA

let, the P'u Ho, a tributary of the Western Liao, before entering the village of the same name, where we breakfasted. The country between Mukden and Fan-chia-t'un is hilly, and the road we traversed is known as the hill road, in contradistinction to a more level road to the west. About fourteen miles separate Fan-chia-t'un from T'ieh-ling Hsien, a very important district city near the left bank of a stream called the Ts'ai Ho. We entered it at 8 A.M. on the 7th of January, and as a telegraph office had recently been established here I was able to send a message to the Governor at Kirin notifying him of my progress. T'ieh-ling is, owing to its position on the Liao, a very important place, and it has become still more important within the last two or three years, on account of the opening up and development of the country to the east of it, and notably the Hai-lung-ch'êng region. The war between China and Japan drove great numbers of people from the south of the peninsula, and they had to seek a livelihood elsewhere. They went north to Hai-lung-ch'êng, and devoted themselves to agriculture in that fertile region. The result is evident to-day.

As we entered the city we encountered string after string of carts laden with beans, which were being deposited in the numerous pawn-shops to be seen on all sides. These shops are not only pawn-shops in the ordinary sense of the word, they contain also large compounds, where beans, millet, and other products are stored in ricks, encircled with the

CENTRAL MANCHURIA

matting already referred to, till the river opens in the spring. The tops of the ricks were everywhere visible, and more were being added. I noticed on the sign-boards of these shops, which were surrounded by high crenellated brick walls, with guns and rifles showing, that arms would not be received in pawn. So great was the bustle and confusion in the streets that our mounted escort had some difficulty in clearing a way for us to get to an inn. The place was full of blacksmiths' shops, where horse-shoes were being turned out, the iron coming from a range of hills in the neighbourhood, and giving the name to the city — T'ieh-ling, or "Iron Range." Crossing the sandy bed of the Ts'ai Ho, the road runs north by east along a plain bounded by low hills, which were partly clad with snow. Gradually the hills close in and give place to another plain of similar proportions, again landing us to the north in somewhat broken country. I have travelled in different parts of China, I have seen the great salt and piece goods traffic between Ssü-ch'uan, Kweichow, and Yünnan, but I never saw a sight which from its magnitude impressed me so much with the vast trade of China as the carrying trade from north to south in Manchuria. Until late in the afternoon, when, owing to a snowstorm, we had to abandon the possibility of making the city of K'ai-yü an Hsien that night, we met at least a thousand carts heavily laden with the produce of the interior, including beans, tobacco, Abutilon hemp, dressed pigs, skins, and large droves of black pigs all bound south. If

MANCHURIA

we take the average team to have numbered five animals, we met some five thousand animals in one day. At one place, where a difficult gully had to be crossed, there was at least one mile of carts, three deep, waiting their turn to pass it. Numbers of men and boys were to be seen on the roads vying with each other in collecting the droppings of animals, which they scoop into wicker baskets. Much valuable manure is thus collected and utilised in the adjoining fields. Many a cart comes to grief, and many a lame animal follows behind its cart. To-day I saw one cart topple over at a difficult part of the road, and the poor pony in the shafts struggling to get up. At another place the axle had snapped and the cart lay useless. Owing to the snowstorm in which we were caught little could be seen of the country. It was sparsely wooded, dreary, and uninteresting, and the cold was intense; our furs were not a sufficient protection. In the last of a caravan of carts from beyond the Palisade I noticed a couple of coffins mixed up with Abutilon hemp and bean-oil. They were tenanted; but later on we met loads of new coffins and parts of coffins all ready to be fixed together on arrival at their destination. Bean-oil is carried in two different ways: in wicker baskets made of willow twigs lined with waterproof paper, the baskets being of various sizes, sometimes as large as a cart itself, and capable of containing 800 pounds of oil, or, for rough roads, wooden boxes, beautifully dovetailed, containing 360 pounds of oil. Most of the oil which comes to the port is carried

CENTRAL MANCHURIA

in boxes, whence the oil is transferred to baskets for export by steamer. The oil is used both for culinary and lighting purposes.

We spent the night of the 7th of January at the village of Sun-chia-t'ai, six miles south of the district city of K'ai-yüan Hsien, and, starting at four o'clock next morning, we crossed two hours later a frozen stream — the Ching Ho, a tributary of the Western Liao — and passed westward outside the south wall of the city and northwards skirting the western wall. It was still dark when we struck the city, and we saw nothing but the high dark walls looming on our right. K'ai-yüan was the scene of one of Nurhachu's greatest victories over the Chinese. The country to the north of the city is broken and undulating, and at a distance of seven miles we entered the village of Ma-chien-t'ai, just within the Palisade, which at one time stretched from the Great Wall of China north-east across the Sungari in the province of Kirin. A gateway and a row of willows were the only things that marked the site of the palisade erected during the Ming Dynasty to keep back the Mongol hordes. Near Ma-chien-t'ai another palisade joined the Western Palisade, whence it ran east and south a little to the east of the Imperial tombs near Hsing-king, and to the east and south of Fêng-huang T'ing. This latter was intended to prevent the raids of Tartar tribes occupying the country to the north and east. Little but the gates, each with its guard of a few soldiers, remains of both palisades. Six miles to the north of the Palisade

MANCHURIA

is the unwall'd city of Yü-shih-ch'êng-tzŭ, now the seat of a prefect and called Ch'ang-t'u Fu. It lies in a plain, to gain which we followed the road over low rounded but evidently cultivated hill-tops. The country near the city, which is mostly built of grey bricks, is well wooded. Twenty miles west by south of Ch'ang-t'u Fu, and at the junction of the two streams which form the headwaters of the Western Liao, there is a very important trade centre called T'ung-chiang-tzŭ (River Junction), whither much of the produce of South-eastern Mongolia and Kirin is brought for shipment. Indeed, the western stream comes from Mongolia itself. North of Ch'ang-t'u Fu, through which a stream of traffic flows to T'ung-chiang-tzŭ, the country continues hilly and undulating, dotted here and there with farmhouses nestling amid elm trees, but there is an absence of the larger villages so common further south. During the whole of winter little life is seen away from the highways, where the whole energy of the country centres in the conduct of the immense traffic to the trade depots. In spring and summer and autumn, on the other hand, when the icy grasp of winter is relaxed and the rivers are open to navigation, the roads, owing to their softness, are all but deserted, and the teams and their drivers, reinforced by many thousands of labourers — annual immigrants from the provinces of Shantung and Chihli — devote themselves to the cultivation of the products of Manchurian soil. At 6 P.M. on the evening of the 8th of January we stopped for the night at the large

CENTRAL MANCHURIA

village of T'zǔ-lu-shu, having covered forty miles since morning. Here we had some difficulty in finding lodgment, for it was full of caravans bound south. During the day we met caravans laden with beans, Abutilon hemp, dressed pigs, coffin wood, and especially tobacco. Several droves of pigs were also going south. It was bitterly cold in the morning and evening, the windows of my cart were frosted hard, and my moustache was frozen to the fur collar of my overcoat.

At a quarter past four next morning we were again proceeding northwards, and at eight o'clock we entered the village of Ssǔ-p'ing-kai, fifteen miles from T'zǔ-lu-shu. It was very dark when we started; each carter had a paper lantern attached to one of the shafts of his cart, and long lines of similar lanterns ahead heralded the approach of strings of caravans. Owing to the length of the teams of large carts each driver walks with a lantern in his hand to show his team the way. During the day he sits on the top of the load in front, and with voice and whip urges on his team. A Manchurian whip is a very formidable weapon. It is about twelve feet long, with a thong of equal length. The butt end is usually a sapling or stout branch of a tree, and lashed to it is a tip several feet long, composed of three strips of split bamboo woven together to a point to give the necessary elasticity. In the hands — it requires both hands to wield it — of a skilful teamster it can be used most effectively, for he can reach any lagging animal of the long team

MANCHURIA

without punishing another. From behind, the whips of a caravan look like so many rod-fishers in the act of casting their lines.

North of Ssü-p'ing-kai the road runs over the same undulating but less wooded country, and after twelve miles we dropped down into the unwalled city of Mai-mai-kai, or Fêng-hua Hsien, the seat of a district magistrate. It was a very busy place, and caravan after caravan was passing through it. The carters were anxious to remain here for the night, declaring that millet for their animals was absurdly cheap, but, as a little too much attention was paid to us by the populace, I told them to buy the millet and bring it along. This they did and off we started, much, I fear, to the regret of the crowd that surrounded us. Four miles more brought us to the hamlet of Pien-lien-ch'êng, where we entered a very large inn, only to be told that there was no accommodation for us; but our escort, always most useful on such occasions, promptly ejected the innkeeper and his staff from a large room used as an office and installed us therein. There was no rest for us, however, until bedtime, for under one pretext or another the servants of the inn kept entering our room from the end where a screen formed the door. So many things had been forgotten; in other words, they wanted to inspect us and our belongings. But the four miles' traffic between Mai-nai-kai and Pien-lien-ch'êng was a revelation to me. The road is downhill, and up struggled the heavily-laden carts with their great loads of beans, Abutilon hemp,

CENTRAL MANCHURIA

frozen pigs, dog skins, immense logs of red pine about three feet in diameter, tobacco, *samshu* in baskets lined with oil-paper, and other articles, while down rushed empty carts at full speed. Our carters and animals caught the excitement, and down we raced over a splendid wide road, polished by wheel and hoof, and shining like a mirror. So far as traffic is concerned, the scene reminded me of the Strand on one of its busiest days. I was surprised at the traffic north of T'ieh-ling, but this was far more imposing.

We left Pien-lien-ch'êng at 4.15 A.M. on the 10th of January in darkness and intense cold, meeting on the way hundreds of carts with their lanterns shining brightly. Here, curiously enough, one of my ponies had the misfortune to part company over night with his fine metal-mounted foreign head stall! The present owner has long ere now discovered that "it's not all gold that glitters." The road continues downhill, and mules and ponies were falling everywhere and regaining their feet without receiving any apparent injury. These animals are exceedingly clever. When the carters prefer the fields to the road, it is very often necessary to make a fairly steep descent to get back to the latter, and then comes the opportunity for the pony in the shafts to show his surefootedness. Down goes the team, and the little animal in the shafts places his four feet together and slides down the incline. He takes good care not to rush the slope like the tracers, but he is frequently dragged to the ground in spite

MANCHURIA

of all his efforts. There was a range of low hills, the summits just visible, to the eastward, some ten miles from the road, and with this exception all that was to be seen was the sun, the blue heavens, and the rolling fields, an eastern prolongation of the Mongolian plains to the westward. The country was comparatively well wooded with elm and willow and dotted about with farmhouses, and here and there I observed a plantation of young trees to all appearance carefully tended. From Kuo-chia-p'u, a village distant some twenty-eight miles from Pien-lien-ch'êng, where we had our forenoon meal, we proceeded northwards over a fine level road, in company with numerous empty carts on their way to K'uan-ch'êng-tzŭ for produce. The traffic was again extraordinary. Four rows of carts again occupied the road, each cart vying with the other to get ahead in the race. A check occurs, and all have to come to a standstill; a large cart going south has upset, and the beans are scattered all over the roadway. These accidents and blocks are taken as a matter of course, and a way has to be cleared before traffic can be resumed.

Five miles north of Kuo-chia-p'u we struck the left bank of the eastern branch of the Western Liao at the southern entrance to the village of Ch'ao-yang-p'o. Here it was a narrow, frozen stream. North of Ch'ao-yang-p'o snow had fallen heavily, and on its hard, slippery surface mules and ponies were rolling about in the most reckless manner, and, as our own teams proved equally reckless, we had

CENTRAL MANCHURIA

to abandon the idea of making Ta-hei-lin-tzŭ, which we had marked out as our resting-place for the night. Caravans with the usual produce were met passing south all day, and we also encountered six droves of pigs going to Mukden — black every one of them. Most of the carters seen during the day wore nose protectors against frost-bite. A protector usually consisted of a cloth band — the centre diamond shaped and covering the nose — connecting the two sides of a cap fastened under the chin. Others wore woollen masks, leaving only the eyes exposed. I frequently found it necessary to tie my handkerchief round my head across my nose in the early mornings. It was impossible to hold the handkerchief in position with the hands, for the latter, encased as they were in lined gloves, became so intensely cold and painful that I had to tear the gloves off with my teeth and wrap my hands in the capacious sleeves of my fur-lined coat. North by east of Ch'ao-yang-p'o the country is well wooded, and by the roadside grew numerous clumps of willow bushes springing up from the roots of old trees. Some eight miles north of Ch'ao-yang-p'o is the village of Ka-lou, and here we had to spend the night with the assurance by the carters that they would easily land us at K'uan-ch'êng-tzŭ or Ch'ang-ch'un Fu, the most important commercial mart in Manchuria, on the morrow. This they did, but it took them fourteen and a quarter hours, for we started at 4.15 A.M. and did not reach the city till 6.30 P.M. My friends of the Presbyterian Church of Ireland Mission

MANCHURIA

received us warmly, and it was with some difficulty that we escaped from them on the afternoon of the following day, the 12th of January. We had now reached the most northern point of our journey, and entered the province of Kirin on its western side. K'uan-ch'êng-tzŭ, which lies on the left bank of the Yi-t'ung, a tributary of the Sungari, is, as stated above, the chief commercial mart in Manchuria. It is the distributing centre for trade to and from Northern Kirin, Hei-lung-chiang, and Eastern Mongolia. The city itself, the population of which is estimated at about 120,000, really stands on Mongol soil, and contains a Mongol office for the collection of land and other taxes; but for administrative purposes it is incorporated with the province of Kirin. Besides being a distributing centre, it is also the seat of several important industries, such as the manufacture of indigo and felt. The former is derived from *Polygonum tinctorium*, L., and the latter is made of ox-hair. The city, which is surrounded by a mud wall, measures roughly four by one and a third miles, and presented a scene of bustle and excitement. We had no time to explore the place, for the Prefect paid me a lengthened visit, and in the course of the interview informed me that he had received instructions from the Tartar General or Military Governor of the province of Kirin to provide a suitable escort to conduct us in safety to the provincial capital, still eighty miles distant. Eight cavalymen, armed with breech and muzzle-loaders of various patterns and swords, were accord-

CENTRAL MANCHURIA

ingly in attendance when we were about to start, but, hearing them grumbling because they had received no money for travelling expenses, I told the petty officer in charge to proceed to his superior officer for the necessary funds. He was successful in his mission, and off we started at 2.30 P.M. in an easterly direction for the city of Kirin. We had not got more than seven miles when the escort hinted that it would not be safe to proceed further that day. This rather staggered us, as the only house in sight was a wretched hovel, consisting of one common room and a small room; but the cavalrymen were equal to the occasion, and induced the occupants to give up the large room for our sole use during the night. After we had settled down, my writer, who had meantime been interviewed by the escort, came and reported that the road between K'uan-ch'êng-tzŭ and Kirin was very unsafe, that brigandage was of common occurrence, that inns were few and far between, and that to go on till dark would simply be to court danger. The stories related by the escort must have been very harrowing, for he was visibly in a state of panic, and we thought it as well to look to our means of defence, and had our revolvers and ammunition overhauled.

We left our miserable quarters at Hou-pai-tzŭ at 4.15 A.M. on the 13th of January, and once more struck east by south. Several ranges of low hills lay ahead of us; some were cultivated, others were russet with scrub-oak. Over and round these meandered the roadway, covered a foot deep with snow.

MANCHURIA

Sixteen miles brought us to the hamlet of Shih-ch'ang (Stone Quarry), where large granite mill-stones were being turned out, and three miles beyond we crossed a frozen stream — the Yi-mu, a tributary of the Yi-t'ung, which passes K'uan-ch'êng-tzŭ. At 11 A.M. we halted at Hei-shan-tsui-tzŭ for a meal. It was a solitary inn at the foot of a low conical hill clad with scrub-oak. We had not long seated ourselves on the *k'ang* in a small room at the west end of the common room, and were making notes of the day's journey, while our cook was busy lighting a fire to prepare our midday meal, when bang! went a number of guns, bullets whistling over the inn. All at once there was the greatest excitement; carters rushed out into the courtyard, which was full of carts; our escort snatched up their guns and followed their example; and my companion and I sallied out with our revolvers to do battle for our property. We were attacked by brigands. Our escort were soon blazing away at different angles of the compound, which was surrounded by a high fence of willow and oak branches, of which the gate itself was also made. Stray shots came whistling along; but, as we could see nobody to fire at, we returned to the room, leaving the escort to carry on the war. Here I found the writer cowering behind the *k'ang* — the raised brick platform containing the brick flues or heating apparatus on both sides of the interior of the inn — in what may be described as a state of absolute funk, and, when I asked him what he was doing, he had some difficulty in replying that

CENTRAL MANCHURIA

he was guarding my property during my absence! The said property consisted of an overcoat, a couple of notebooks, a pencil, and a compass. Now and then the escort rushed in advising us not to be afraid, and I as often told them that we were not at all afraid as we could depend upon our revolvers. This was not exactly what they wanted, for they evidently required as much cheering up as my writer. When, however, a bullet came whistling into the room in which we were seated and scattered the mud from the opposite wall, we thought things were getting rather hot, and again sallied out to battle. My companion's blood was now up, and, snatching the Winchester repeater from the sergeant of the escort, he determined to get a long shot. By this time my companion's gun-case had been extracted from his cart by the cook; but, in spite of the prayers of the escort, who carried muzzle-loaders, for shot, we were unable to open it, the lock having got jammed by the jolting of the cart. When we rushed into the courtyard the second time the gate suddenly flew open and in dashed a laden cart, the carter urging his team at full speed. "Shut the gate! shut the gate!" was shouted on all sides; but before that could be done in crawled a white pony — a veritable bag of bones. This the escort annexed, declaring that it belonged to the brigands, and, as nobody else claimed it, they at once entered into possession of this trophy of war. My companion did not get a chance with the sergeant's Winchester, for the firing became more desultory and soon ceased. The

MANCHURIA

brigands had gone west, and a verbal message was sent to us, through Chinese travellers who came into the inn, that had they known we were foreigners they would not have attacked us; that they had no animus against foreigners; and that they would now allow us to pass unmolested. Five men afterwards came in and declared that they had been robbed of their fur clothing. A discussion now arose among the members of the escort as to the number of the brigands; some said forty-two, others forty-four; but the majority seemed to hold by the higher number. They may have been right, but neither my companion nor I saw one. They maintained that they wounded several of them, and when we came to review the loss on our side we discovered a pony yoked in a cart in the middle of the courtyard with a fresh wound under one of its fetlocks. We afterwards met from time to time many men in chains on their way to the capital of the province, and I have reliable authority for stating that about a thousand heads fall every year. There was little cultivation among these hills, and high brushwood afforded excellent cover for robber bands. What struck me as being very peculiar in the whole affair was the utter indifference of the employés of the inn: they went about their usual duties as if nothing was happening, and I came to the conclusion either that they were inured to these affrays, or that they were hand-in-glove with the brigands. I am inclined to think that the latter is the more reasonable conclusion.

CENTRAL MANCHURIA

Having finished our meal, the preparation of which had been so unwarrantably delayed, we left the inn ready for action, but not a trace of a brigand was to be seen. Emerging from the hills at 2 P.M. we entered on an undulating, fairly wooded country, and put up for the night at Hsin-lung-tien, where the local military authority informed me that he had received instructions from the Tartar General to add four more cavalymen to our escort. Of trade we saw little during the day: coffins, coffin wood, tobacco, charcoal, and dressed pigs were being conveyed to K'uan-ch'êng-tzŭ mostly in sleighs.

It was intensely cold when we again faced eastwards on the morning of the 14th of January. At five o'clock the coats of our teams were all frosted white and the queues of the drivers and even the hairs of my overcoat were all of like colour. The road passed over flat then undulating country, crossed low hills, surmounted a low range, and entered the village of Ta-shui-ho, the junction of the commercial and imperial roads from Mukden to Kirin. Three miles west of Ta-shui-ho we crossed a small stream and another at Ta-shui-ho itself. These unite further north and go to join the Sungari. Before entering the village we struck the telegraph line from the south, which runs north through Kirin and Tsitsihar to Russian Siberia at Blagoveschensk. On leaving Ta-shui-ho we entered among low hills russet with scrub-oak, and apparently forming the western foothills of a range about 3,000 feet high further to the east. The road winds out and in

MANCHURIA

among these hills, seeking an eastern outlet, and at a distance of seven miles from Ta-shui-ho reaches its highest altitude at the low but steep Lao-yeh Ling Pass. Perched on the summit of the pass are two beautiful temples — Ling-yen-ssŭ and Kuan-ti Miao — in excellent repair, and one can imagine what a lovely spot this must be when the oaks, willows, and elms, which thickly dot the hills and encircle the temples, have decked themselves in their summer greenery. Even in winter, with its mantle of snow, the pass was enticing. We descended to the hamlet of Erh-tao-ling-tzŭ, where we remained for the night. We had hoped to make Kirin before dark, but we were still about ten miles from the Mission House of the Presbyterian Church of Ireland, which lies outside the east gate of the city, whence Dr. Greig had sent a cordial invitation to us by special messenger to make his house our home during our visit. The messenger met us early that morning, and had returned with our acceptance of the kind invitation. We did not leave Erh-tao-ling-tzŭ next morning till 6.30 o'clock, and at grey dawn Dr. Greig and the Rev. Mr. Crawford of the Irish Mission, who had come out in their sleigh to meet us, gave us a hearty welcome. They insisted on our taking their places in the sleigh. Two low ridges still hid our destination from view, and, on surmounting the latter, we came in sight of Kirin and the frozen Sungari just as the sun began to peep over the eastern hills.

The city of Kirin, the capital of the province of

CENTRAL MANCHURIA

that name, in lat. $43^{\circ} 49' N.$ and long. $126^{\circ} 46' 27'' E.$, occupies for two miles the left bank of the Sungari, in a bend where the river sweeps from west to east on its way to join the Amur. It also goes by the name of Ch'uan Ch'ang, or "Dockyard," because it is the chief boat building centre on the Sungari. It stretches northwards from the river somewhat irregularly, and is surrounded, except on the river side, by a crenellated grey brick wall some thirteen feet high, with eight gates. Houses, many of them on piles, face the river, whence a number of gates give access to the town. Here the valley of the Sungari lies within an amphitheatre of hills, which were all clad with snow at the time of our visit. There is an extensive growing suburb outside the west wall of the city, and here, at a stone's throw from the road leading to the west gate, is the execution ground, while the branches of a row of trees to the south of the roadway are utilised for exposing the heads of criminals. We entered the city by the west gate, and passed through it along the street which skirts the left bank of the Sungari, emerging by the small east gate. A mile from the latter is the station of the Irish Mission, where we were most comfortably housed and hospitably entertained for a fortnight. During the first few days of our residence I was busy discussing and settling with the native authorities the case which had brought me to Kirin, and when that was finished I had leisure to visit the city and the sights in its neighbourhood. I should mention that eight mounted men — part

MANCHURIA

of the Governor's bodyguard — were always in attendance upon us. One day we descended to the Sungari, which in winter is utilised as a highway for sleighs, carts, horsemen, and foot passengers, skirted the city for some distance, passing piles of wood floated down the river in the season and caravan-saries surrounded by long wooden piles standing vertically in the frozen river, entered the city, and crossed it from south to north, recrossing it from west to east on our return. The western part of the city is occupied for the most part by public offices and the residences of retired officials, while the centre and east are given up to business. The population cannot be far short of 100,000. I noticed many good shops and one or two pretty temples. The streets, some of which are paved with wood, are not so wide as those of Mukden: they were covered with hard snow, but in the rainy season, according to Mr. James,¹ they are a quagmire. What must strike every visitor to Kirin is the vast quantity of wood used in fencing compounds. Long, huge logs grooved on two sides are driven into the ground six to eight feet apart, and the ends of planks, many of them several inches thick, are dropped into the grooves, thus forming a wall. Did the carpenters of Kirin possess decent nails, at least two-thirds of this valuable timber could be saved for other purposes. And the workers in wood of Kirin are exceedingly skilful. Furniture, in fact, is one of the specialties of the city. I saw shops full of beautiful

¹ *The Long White Mountain*, p. 283.

CENTRAL MANCHURIA

oak cabinets, chairs, and small low tables for serving food on *k'angs*. These little tables appeared to me so graceful and neat that I promptly bought four of them. Another special industry of Kirin is the tanning of hides and the manufacture of shoes. The *wu-la*, or Manchurian shoe, as it may be called, is of peculiar make. The uppers and sole are one piece of brown leather gathered in over the toe by hemp twine, with an angle-shaped tongue sewed to the uppers, and rising over the instep to keep out the snow. The sides are rudely sewed at the heel like a foreign shoe, but a small semi-circular piece of leather — a prolongation of the sole — is drawn over and sewed half up the back to keep the two sides together and in proper position. Two large nail heads, riveted through the sole, usually form the heel. The shoes are fastened to the feet by thongs of raw hide passing through eyelets in the uppers. These shoes are worn only in winter, when they are padded with a fine grass which grows to a height of about two feet in the marshy lands of Kirin and Hei-lung-chiang. This grass, called *wu-la-ts'ao*, is softened for use by beating with a wooden mallet.

We fared sumptuously in Kirin: frozen fish, including the sturgeon, were exposed in heaps on the streets for sale, and frozen game included partridge, pheasant, deer, antelope, and wild boar. The Governor presented me with a deer, an antelope, several kinds of fish (including two sturgeon), a box of frogs and another of sparrows — all frozen.

Two miles to the south-east of the city and in the

MANCHURIA

same bend of the river is the arsenal, which the director kindly threw open to our inspection. His predecessor, Sung Taotai, who entertained Mr. James and his party in November, 1886, was also present, but he was living at the arsenal as a guest, having been appointed director of a gold-mining semi-official syndicate at San-sing, whither he was bound. After conducting us over the building, where we saw cartridges and gingals being turned out, they insisted, although I had expressly requested that no preparations should be made, on our sitting down to a feast. In spite of the fact that we had just finished our midday meal, we were unable to resist the kindness of our entertainers; but I fear that we failed to do justice to the sumptuous repast which was spread temptingly before us. Every available delicacy was produced; even hot *samshu* and iced champagne were not wanting. On the opposite bank of the river are the powder mills, also surrounded by a high wall. These we did not visit. The breadth of the river between the arsenal and the mills is about 300 yards. Oak charcoal is the principal fuel used in the arsenal; it is said to be much cheaper than coal, which can also be had in abundance. Charcoal costs only one cash a catty, or about \$1.68 a ton, whereas coal costs from \$3 to \$6 a ton, according to quality. The inferior coal is soft and burns rapidly. Both fuels come down the Sungari.

Some four miles to the south-west of the city, and a mile or more from the left bank of the river,

CENTRAL MANCHURIA

rises the Hsiao Ch'ang-pai Shan (Small Ever-White Mountain) of which the Ch'ang-pai Shan (Ever-White Mountain), in the south-east of the province, is the prototype. It is reserved as a hunting ground for the Emperor. This we visited on the 23rd of January, sleighing along the Sungari till it is joined on the west bank by a small tributary, which we ascended for a short distance, and then struck overland to the base of the hill. It is thickly wooded with oak, and here and there a few pines. On sloping ground at the base there is a corral enclosed by high timber logs driven into the ground, and containing about fifty deer. There are three hill-tops, none exceeding 500 feet in height. One of these is crowned by a small temple, to which we ascended through snow, a foot in depth. The temple, which stands on a stone platform three feet high, and measures nineteen yards long by seven yards broad, consists of a single lofty room with pillars and ceiling beautifully painted in blue and gold. The eaves of the roof project on the four sides, forming a verandah supported by twenty-two fine wooden pillars painted red. In front there is a small courtyard with a few stone steps leading to the entrance. The whole is surrounded by a stone wall with two gates. In the middle of the room there is a small altar with a black-lacquered wooden tablet inscribed in Manchu and Chinese gold characters, "The Genii of the Ever-White Mountain." In front of the tablet is a censer for holding the joss sticks. Hither twice a year, in the second and eighth Chinese months,

MANCHURIA

the Military Governor and his subordinates repair, and, in the Emperor's name, do homage to the genii of the ancestral house of the Manchu Dynasty. They prostrate themselves outside the open doorway facing the altar, as no one dares enter the holy of holies. From the Hsiao Ch'ang-pai Shan caps of deer-skin are sent to Peking twice a year for the Emperor's use.

Next day we made an excursion to the Lung-t'an Shan (Dragon Pool Hill), which lies to the north-east of the city, and on the right bank of the Sungari. We struck the left bank of the river, where a couple of steam launches were docked — one was frozen in, and had her hull at the water-line cased with straw to prevent her being nipped by the surrounding ice, which bore signs of being frequently broken, and the other, the smaller of the two, had been dragged on to the top of the ice. Proceeding northwards along the left bank, we passed a low rounded hill (Tuan-shan-tzŭ), which projects into the river from the right bank, with which it is connected by a neck of low land. This hill, which still bears evidence of having been fortified, is supposed to have been in former times a Korean stronghold. Near this place a cable crosses the river and connects the land lines. To the north of this there was a strip of open water at some distance from the right bank, where a couple of dab-chicks were busy diving. As the thermometer had that morning registered 27° below zero, Fahr., there can be little doubt that the open water was due to the presence of springs in the bed of the

CENTRAL MANCHURIA

river. The Lung-t'an Shan presents a fairly precipitous face to the river, and we crossed to the right bank at the north end of the hill. A few hundred yards inland the telegraph branches, one line going north to Tsitsihar and Helampo, the other east to Hun-ch'un. Ascending the hill from the rear we soon reached the temple and the small dragon pool, now frozen, passed a sacred elm enclosed by a wooden rail, and soon reached the summit of the hill, whence we had a splendid view of the valley, 700 feet below, the winding Sungari, and the city of Kirin, with their encircling hills all robed in a mantle of snow. This temple is a favourite resort of officials and people of Kirin in summer; here they come to feast and while away an idle hour or two under the shadow of the oaks and elms with which the whole hill is clad.

We left Kirin at 10 A.M. on the 28th of January on our return to the port. Instead of retracing our steps by way of K'uan-ch'êng-tzū we resolved to follow the imperial highroad, which runs south-west from Kirin and joins the main road a little to the south of K'ai-yüan Hsien. To effect this, however, we had to return to Ta-shui-ho, where these two roads branch. As more snow had fallen on the two days previous to our departure, our carters were unwilling to attempt the Lao-yeh Ling Pass, fearing it would be blocked. We accordingly skirted the bases of the hills west by south-west for some distance, then entered among them, and, crossing a low pass, descended through narrow valleys till we struck the road leading to the Lao-yeh Ling, which we had

MANCHURIA

thus circumvented. This we followed to Ta-shui-ho, which we now found full of soldiers returning to Hei-lung-chiang from the south. Dr. Greig and Mr. Crawford accompanied us outside the west gate, a petty official armed with the Governor's card awaited us outside the west suburb and wished us *bon voyage* on His Excellency's behalf, and we were provided with an escort of six mounted men to see us safely to the frontier of the province. From Ta-shui-ho the road goes west by south over undulating country, each wave of land sinking lower as we advanced. To the east there is a range of low hills following the direction of the road. At the end of twenty-five miles we struck a plain, at the north end of which lies the village of Ch'a-lu-ho, cut in two by a stream of the same name on its way north-west to join the Yi-t'ung and the Sungari. We started at 2.30 A.M., and found the morning bitterly cold. Just after sunrise we left our carts for a walk over the snow, and my companion at once remarked that my nose, with the exception of a round snow-white spot the size of a ten-cent piece on the tip, was very red. It was numb, and vigorous rubbing for half-an-hour induced circulation and saved me from frost-bite. As usual, the carters' queues and the animals' coats were frozen white. In the inn at Ch'a-lu-ho, where we had a meal, a number of brigands in chains were being fed; they were bound for Kirin, and were carefully guarded. Crossing the plain we again entered on rough, undulating country, evidently little cultivated. The tele-

CENTRAL MANCHURIA

graph line runs straight across, but the road winds about in order to circumvent numerous gullies which had every appearance of being swept out by the rains. At 5 P.M. we stopped for the night at the hamlet of La-yao-tzŭ, having been on the road for fourteen and a half hours and covered forty-three miles. Here there was no trade worth mentioning: we met Hei-lung-chiang troops straggling northwards all day.

From La-yao-tzŭ, which we left at 2.30 A.M. on the 30th of January, the road descends west by south through broken hilly country, fairly wooded with willows, oak, and elm, but showing fewer traces of cultivation. Thereafter it winds southwards through hills, descends and crosses a stream, a branch of the headwaters of the Yi-t'ung, surmounts a range of hills, and then descends west by south to the city of Yi-t'ung Chou, which lies on the left bank of the stream. There is a wooden bridge over the Yi-t'ung, but we crossed on the ice, and, without entering the city walls, proceeded to the suburbs in search of an inn. Wherever we went we were refused a resting-place, on the plea that the inns were full of passing soldiers. In addition to this, it was market day, and the streets were crowded with people haggling over frozen fish and pheasants, *wu-la* shoes, salt, and wooden and earthenware utensils of various kinds. I sent one of the escort to the Sub-Prefect to report our arrival, and request his assistance in obtaining accommodation for the night. He soon returned and conducted us to a large storage house,

MANCHURIA

where we were just as comfortable as at an inn. The Sub-Prefect sent his regrets that he was unable to call upon me, as he had an engagement at the execution ground that evening, and, just as we were settling down, the music of the procession thither broke upon our ear. Throughout the day we met soldiers and a battery of field guns on their way to Hei-lung-chiang.

Yi-t'ung Chou, like T'ieh-ling, is a great storehouse for beans and grain, and there is an extensive trade between the two cities. As we approached the former we met numerous empty carts returning to the country districts whence it draws its supplies. Their teams were mainly composed of oxen. The beans go to T'ieh-ling for shipment to the port, and the carts return empty, or laden with salt from the Liao-tung Peninsula.

From Yi-t'ung Chou the road ascends for twelve miles to the village of Ta-ku-shan, which lies at the base of a hill of the same name, about a thousand feet high. The lower part of the hill, which we left on our right, was covered with snow. Thereafter the road descends and again ascends over billowy land till it drops into a plain, wherein lies the prosperous village of Hsiao-ku-shan. To the east of the village is a pretty little temple perched on a wooden knoll, with the telegraph line immediately to the east of it. A range of low hills runs north and south to the east of the plain.

On leaving Hsiao-ku-shan we crossed a stream and proceeded west by south over rolling country, backed

CENTRAL MANCHURIA

by low ranges of hills. These we surmounted, and put up for the night at Huo-shih-ling-tzŭ. A number of difficult places for traffic presented themselves during the day, and the carts and their teams on the snow-clad ridge sides looked like a swarm of ants at work.

Descending from Huo-shih-ling-tzŭ the road goes west by south through confused hills, and, passing Yeh-ho, at one time the capital of a Manchu principality, enters a narrow valley bounded by low hills, which ends at Huang-hua-tien. Before entering Yeh-ho we crossed the headwaters of the Eastern Liao. Thereafter the valley widens, and the road crosses an undulating stretch of country, backed by a range of hills, then white with snow. Some of the hills were russet with scrub-oak. Passing through the hills we proceeded south, crossing a stream which afterwards flows past K'ai-yüan Hsien, and then struck south-west to Wei-yüan-p'u on the southern boundary of the Kirin and Fêng-t'ien provinces. The traffic along the route was enormous, almost as great as between Mai-mai-kai (Fêng-hua Hsien) and K'uian-ch'êng-tzŭ (Ch'ang-ch'un Fu). At Wei-yüan-p'u the escort from Kirin left us. We occupied cold, miserable quarters at the frontier town, and kept the innkeeper and his men busy stoking our *k'angs* with stalks of Abutilon hemp, which appeared to be the ordinary fuel of the place. For three days running we had started a little after 2 A.M., but we did not leave Wei-yüan-p'u till 3.45 on the morning of the 2nd of February. On passing through the

MANCHURIA

southern gate we entered the province of Fêng-t'ien, and found that hills no longer barred our way. The road lay over a level plain bounded by hills on both sides running north and south. We struck the T'ieh-ling-K'uan-ch'êng-tzŭ road at Sun-chia-t'ai, south of K'ai-yüan, where we had spent the night of the 7th of January, and we were now on well-known ground. Four miles beyond we were stopped by a block in the road: wheels were being lashed to prevent carts slipping downhill — brakes being unknown — and we did not reach T'ieh-ling till 5 P.M. We determined to push on, however, and ultimately put up for the night at the village of Liao-hai-t'un, where we found a very good but excessively cold room. It was dark when we arrived, and all endeavours to heat the *k'ang* proved of no avail. During the day we met numbers of Shantung men going north, bound for Pa-chia-tzŭ, which lies to the west of K'uan-ch'êng-tzŭ, and whole caravans of families on their way to settle in the Hai-lung-ch'êng region.

Forty miles still separated us from Mukden, and although we left Liao-hai-t'un at 3.15 A.M. on the 3rd of February, we did not enter the provincial capital till 7.30 P.M. From T'ieh-ling we traversed a new and more level road to the west of the road we followed going north. The country was well wooded with willows and elms, but on leaving the Kirin province we left the oak-clad hills behind us. There was little trade along this new road. We spent the 4th of February in Mukden, and next

CENTRAL MANCHURIA

day retraced our steps to Liao-yang, meeting on the way several caravans laden with empty bean-oil boxes and bales of yarn for the capital. They were bound for the far interior, beyond the Palisade. Carts with willow twigs from Niu-chuang, intended for the manufacture of oil and *samshu* baskets, and with salt from the port, were also going north. The evaporation of salt from sea-water under Government license is a great industry in the Liao-tung Peninsula, which is described in another chapter, and the product is brought to the port by junk in the open season and by cart in winter. From New-chwang it is carried into the interior by the boats which bring down the beans and by carts when the river is closed by ice. Leaving Liao-yang at 3 A.M. on the 6th, we followed the road by which we had come as far as Sha-ho-tzŭ, a distance of ten miles, and instead of continuing towards Hai-ch'êng struck west by south for the inland town of Niu-chuang, one of the battle-fields during the war. We were unable to make that place the same day, however, for one of the mules of my companion's team, which had been showing signs of lameness for a day or two, broke down, and, as its owner was unwilling to leave it behind when we were so near the port, we made but slow progress. An-shan (Saddle Hill) was prominent on our left during the early part of the day, and the road lay over a country so flat as to be painfully monotonous. There was very considerable traffic, for we were now on the great highway from the port to Mukden: caravans of empty bean-oil

MANCHURIA

and *samshu* baskets, salt, paper, and cotton goods in bales going north, and Abutilon hemp accompanying us to the port. The village of Ku-ch'êng-tzŭ, seven miles from Niu-chuang, was our resting-place on the 6th, and at 2 A.M. on the 7th we started on our final stage. We passed through Niu-chuang long before daylight, and I regret to say that we saw nothing of the town which has given its name to the port. We entered and left it by gates; but my writer, who left us at Mukden, in his hurry to get home to make preparations for the China New Year, and passed through it during daylight, afterwards informed me that it has not yet recovered from the damage which it sustained during the war. It was here that several hundred Chinese troops were surrounded by the Japanese, and, after a desperate struggle, obliged to surrender, many of the younger officers cutting their own throats rather than fall into the hands of the enemy. A Japanese officer, who was engaged in the fight, and came to see me two days after, was my informant. We met the usual number of caravans on the same level flat, and rode into the port of Newchwang at 2.30 P.M., after an absence of five weeks and two days.

CHAPTER IX

TO PORT ARTHUR AND ALONG THE EASTERN FRONTIER

WHEN I had ascertained that my furlough, for which I had been waiting a year, would be granted in the spring of 1900, I set about discovering how much of the Siberian Railway was actually completed, and whether it would be feasible to return to England by this route with my wife and son, nine years of age. The information obtainable was very conflicting: some Russians in Newchwang assured me that the line from Stretensk to Lake Baikal had just been finished, and that I could depend on being able to travel by rail, with the exception of the crossing of Baikal, from Stretensk to Moscow and St. Petersburg, while others stated that there was still a considerable hiatus between Stretensk and the lake, that it would be necessary to ride or drive, and that travelling by construction trains, which alone would be available, would be of the roughest description. Open trucks, I was told, might be our fate. But one Russian gentleman told me that he had actually travelled from Baikal to Stretensk by rail in the autumn of 1899, and that, in all probability, great improvements

MANCHURIA

had been effected since that time. This settled our homeward route. For myself it mattered not, as I intended to follow the track of the Manchurian or Chinese Eastern Railway from Port Arthur to the Trans-Baikal province, taking advantage, as much as possible, of the sections already completed and in course of construction. At the same time I attempted to work up a smattering of Russian; but I may say here that, although I succeeded in being able to express my actual wants, I found that my vocabulary, when really put to the test, was totally insufficient to grapple with the difficulties encountered or to elicit desirable information. As my Russian colleague at Newchwang, who was also proceeding on furlough, promised to accompany me, while our respective families were to meet at Vladivostock and travel together by rail and river to Stretensk, I laid little stress on a knowledge of Russian. My knowledge of Chinese would make the Manchurian part of the journey comparatively easy. When the above arrangement was arrived at, I procured from His Majesty's Minister at Peking two passports, one for my family and another for myself, both of which were duly viséed by the Russian Legation prior to transmission. Meantime my colleague informed me that he was unable to travel through Manchuria, but that he would accompany his family to Vladivostock, where, on a date to be fixed by him, he would meet my family and travel with them to Stretensk. My family then left for Shanghai to await the announcement of the

PORT ARTHUR

date, and I handed over charge to my successor on the 8th of April. On the morning of the 10th I started for Port Arthur by rail, and arrived there on the afternoon of the 11th. Next morning I left Port Arthur again by rail, on my projected long journey through Manchuria; but on arrival at Newchwang, on the evening of the 13th, I was rather surprised to learn that my fellow-traveller-to-be had again changed his mind and his plans, and that he now proposed to return to Russia by way of Peking, Kalgan, and Kiakhta. I was also told that washouts had occurred in the line between Newchwang and T'ieh-ling, which was then the rail-head north of the port, and that if I wished to travel by train I must wait till the necessary repairs were effected. My plans, like the line, were now blocked; my wife's Russian vocabulary was more limited than my own, and it was utterly impossible for her to proceed to Stretensk by way of Vladivostock, Habarovsk, and Blagoveschensk without assistance; while the railway on which I had depended for a long lift at the outset of my journey was unavailable for some indefinite period. There was no help for it but to proceed to Shanghai, thence take steamer to Vladivostock, and travel round, instead of through, Manchuria. Before attempting a description of this journey, to which this and the following chapter will be devoted, I must say a few words regarding my trip to Port Arthur.

On the evening of the 9th of April, 1900, I rode in a Chinese cart to the Russian railway station at

MANCHURIA

Niu-chia-t'un, where I dined with Mr. Titoff, the resident engineer. This gentleman, to whom I am indebted for many kindnesses, not only to myself but also to friends who had from time to time requested my assistance in procuring permission to travel on the line, had kindly placed at my disposal a comfortable carriage in the train which was to start early next morning. At dinner I met the newly-appointed Financial Commissioner at Port Arthur, who spoke English fluently, and manifested a great interest in the financial condition and taxation of Manchuria, more especially the taxation of trade. He was a fellow-passenger to Port Arthur, and lost no opportunity of discussing with me the future commercial probabilities of the Manchurian railway. On the probable strategical value of the line we said nothing. The total length of the track from Newchwang to Port Arthur is 275 versts, or, roughly speaking, $183\frac{1}{3}$ miles. We started at seven o'clock, and after a run of one hour and forty-five minutes over flat country reached Ta-shih-ch'iao, a large station with numerous sidings on the main Manchurian line, seventeen miles east of Newchwang. Owing to heavy rains the previous day and the lack of satisfactory ballast the track was soft, and the train had to be run with care. Before arrival at the station, which lies about half a mile to the north-west of the village after which it is named, we crossed a stream, flowing south, by a temporary wooden bridge, close and to the south of which pile-driving was proceeding, and the granite

PORT ARTHUR

abutments for the iron roof of a small bridge were being built. To the east of Ta-shih-ch'iao a range of low hills runs north towards Hai-ch'êng and south to the Liao-tung Peninsula, while to the west a few isolated hills dot the plain. To the eastern face and near the summit of the highest of the latter clings Yao-chou Miao — a temple of several courtyards — named after the hill on which it is built, Yao-chou-shan. The main line runs north and south on the flat between the range and the isolated hills; but the latter quickly disappear, leaving a low, bare plain stretching westward to the sea. A dreary-looking waste now; but in the summer and autumn, when I have visited it, this plain is a centre of activity, for here it is that the greater part of the salt consumed in Manchuria is manufactured. A light line was laid down from the station at Ta-shih-ch'iao to a hill half a mile to the north-east, whence ballast was being excavated. We were now joined by another passenger, a Russian doctor from one of the railway hospitals, bound for Port Arthur. He was going to attend a meeting of a society — botanical, I imagine — recently formed at Port Arthur, and he was very keen on the question of the afforestation and beautifying generally of the bare hills surrounding Russia's new naval port. He was also anxious to find a spot on the Liao-tung coast for a sanatorium, which would rival the summer health-resorts of China and Japan.

The first station south of Ta-shih-ch'iao is Hai-shên-chai, a little to the south-east of a village of

MANCHURIA

that name nestling at the base of a hill, for the western flat has now given place to hilly ground. The station lies on the right bank of the Kai-chow River, almost midway between the sea and the district city of Kai-p'ing Hsien, which is concealed by hills to the east. The river, with its sandy bed one hundred yards in width, becomes during rains a roaring torrent, and has on more than one occasion swept away the piles of sleepers which were doing duty for piers. Stones and rails supported the track when we crossed the river; but a five-arched bridge with granite piers was in process of construction. Between the Kai-chow River and Hsiung-yao, a distance of twenty miles, two streams rising in the hills to the east cross the track on their way to the west coast. The five-arched stone bridges over these were completed, and the banks of the stream above the bridges were carefully paved with stone to keep the floods within bounds. Hsiung-yao, at one time the seat of a Department, and later of a District Magistrate, as well as the headquarters of a Deputy Lieutenant-Military-Governor, afterwards transferred to Chin-chou T'ing, is a small walled town a mile to the west of the railway. Its inhabitants are mostly Bannermen, and its defences are in charge of a Manchu Military Commandant of the second class (Fang Shou Yü). The town lies in a plain stretching westward from the railway to the sea and eastward to low hills backed by a higher range running north and south. In the eastern part of the plain are a number of bare, isolated

PORT ARTHUR

rocks, on the southernmost of which perches a small pagoda. The run from the Kai-chow River to Hsiung-yao occupied one hour and fifteen minutes. The Hsiung-yao River, which crosses the track opposite the town on its way westward to the sea, has a wide sandy bed, necessitating a long bridge of some ten spans, in course of construction. This is the longest bridge on the line, and here stone and gravel banking were being carried out to confine the river to its bed. South of Hsiung-yao the hills close in on both sides, forcing the railway into the intervening valley and here and there into the hillsides to the east, where one or two rock scarpings several hundred yards in length had been executed. At twelve minutes past noon we arrived at Hou-wa-fang-tien, a neat little station in the valley, where we stopped for ten minutes, and then proceeded south, the rails being now laid in the bottom pending the completion of a number of bridges across gullies in the hills to the west. At one point in the valley I counted as many as four bridges visible at one time. At Hou-wa-fang-tien we passed a construction train going south, laden with dressed stones to be used in bridging a number of small streams crossing the track between Hou-wa-fang-tien and Ch'ien-wa-fang-tien or Nan-wa-fang-tien, which are about twenty-seven miles apart. At all these streams stone embanking had been carried out to the east of the bridge sites. Half a mile to the north of Nan-wa-fang-tien, which we reached at 6 P.M., and where we remained overnight, a branch line was being

MANCHURIA

built eastward to the Lu-shêng coal mines, three miles distant. These mines are generally known as the Wa-fang-tien coal mines. Earlier in the day a construction train with rails and coal had passed us at Hsiung-yao bound north. Nan-wa-fang-tien is one of the largest stations on the line, with numerous sidings, engine sheds, and quite a number of artisans' cottages. Half a mile to the east the Russian flag was flying over a prominent building. I may state here that we carried our own bedding and provisions; but the doctor on our arrival at Nan-wa-fang-tien set out on a foraging expedition, and soon returned with a tureen of hot cabbage soup, to which, as the evening was cold and wet, we all did ample justice. We completed the repast with a cold roast fowl and cold beef provided by me, and glasses of hot tea *à la Russe*. North of Nan-wa-fang-tien scrub-oak put in an appearance, an indication that we were passing through the districts of sericulture in Southern Manchuria.

We left Nan-wa-fang-tien at 5.30 A.M. on the 11th of April, and, after an hour's run past villages and farmhouses nestling amid trees as yet bare of foliage, reached P'u-la-tien, the northern boundary on the west side of the territory leased to Russia by China. The boundary line passes through P'i-tzŭ-wo, on the eastern side of the peninsula. To the immediate north of P'u-la-tien, where I noticed for the first time the name of the station posted in Russian, preparations were being made for bridging a stream flowing west. South of Nan-wa-fang-tien the coun-

PORT ARTHUR

try opens out, and consists of rolling land with hill ranges in the distance. Fifteen miles south of P'u-la-tien we struck the Hung-kou-ho, a stream also flowing west, where extensive banking and bridging were progressing. Two and a half miles more brought us to the station of San-shih-li-p'u, which we reached at eight o'clock. Passing the station of Shih-san-t'ai-tzū, with the sea visible a few miles to the west, we crossed the wide bed of a stream, which has to be bridged, and arrived at the station opposite the city of Chin-chou T'ing, which lies one and two-thirds miles to the west, at the base of hills on the north side of Chin-chou Bay. In the lease of the territory to Russia it was stipulated that the Chinese should continue to exercise jurisdiction within the walls of this city, and difficulties have frequently arisen in consequence of this arrangement, for in the open the Chinese are under Russian rule, but by entering the gates they become amenable to Chinese authority. Chin-chou is a very large station, with a short branch line to brickfields on the west side — a concession granted by the Russian Government to the Chinese Eastern Railway Company in connection with the site of the new town of Dalny about to be built on the south shores of Ta-lien-wan Bay. Quite a number of houses had already been built at the brickfields, and others were in process of construction. The city of Chin-chou lies at the north end of the narrow neck of land which separates Ta-lien-wan and Chin-chou Bays, and the sea is visible from the railway on

MANCHURIA

both sides, the country being flat from sea to sea. At most of the stations along the track, and especially at Chin-chiu, Chinese hawkers were busy catering for passengers: hard-boiled eggs, tinned meat, fish and fruit, fresh pears and oranges, sunflower and pine seeds, and occasionally aerated waters were to be had. On my return journey from Port Arthur reliefs for the military guards along the line travelled by the same train, and it was very interesting to watch the way in which these soldiers fraternised with the Chinese employés of the railway: they shook hands cordially and slapped each other on the back as if they had been life-long acquaintances. The friendship did not appear to be always disinterested, however, for the soldier not unfrequently produced an empty *vodka* bottle and a coin, both of which were slipped into the hands of the Chinese friend, who might be seen speeding hot foot to the nearest dram shop or itinerant spirit vendor. A number of small boys seemed always to be on the outlook for errands of this description, and were not unfrequently rewarded with the offer of the dregs, which were usually declined, the wage for their labour being doubtless recouped by the difference between the actual cost and the price charged to the buyer. These soldiers took every possible opportunity of eating and drinking, and if they were not devouring loaves of bread, they were emptying bottles without the intermediary of glasses. One thing must be said for the Russian soldier: his pay may be small, but his generosity is unbounded. I

PORT ARTHUR

have seen him part with his loaf to a Chinese beggar — who was well represented along the line — and appear delighted that the meal was appreciated. Many of the soldiers had a smattering of Chinese, and one man — it was at the end of the journey and after numerous refreshers — endeavoured to harangue a crowd in their own tongue. His speech created considerable hilarity among his audience, and he seemed gratified at his success.

At Ta-fang-shên, four miles south of Chin-chou, a branch leaves the main line and goes east, skirting the southern shore of an arm of the sea forming the northern part of Ta-lien-wan Bay, to the village of Ta-lien-wan, where a pier has been built for the accommodation of steamers carrying materials for the railway. Ta-lien-wan Bay is free of ice during the winter months, so that materials can be landed there when the port of Newchwang is closed. The branch line is about three miles in length. On leaving the narrow neck of land at Ta-fang-shên the main line, after skirting the western end of the middle arm of the sea in Ta-lien-wan Bay, goes west by south for a distance of ten miles to the station Nan-san-shih-li-p'u, to the south of which a branch ten miles long was being constructed eastward to the new port of Dalny in the south of the bay. To the west and south of the bay the country is broken and hilly, and the track has been carried along the western shore, in one or two places being built upon the sandy beach within a few yards of the sea, whence it ultimately crosses the south of the

MANCHURIA

peninsula and descends into Port Arthur, which we reached at 3.30 P.M. on the 11th of April.

Port Arthur, until little more than two years ago China's greatest naval station in the north, is an oval inlet of the sea some two miles long from east to west and a mile from north to south, surrounded by high hills, and entered on the south side by a narrow channel guarded at the south end by a couple of reefs, and protected against storms by a spit of land which runs diagonally across its northern end. A line drawn from this channel to the extreme west of the town, which occupies the face of the hills on the north-east side of the inlet, divides the latter into two unequal parts, known respectively as East and West Bays. The former is small, and has accommodation for a very limited number of vessels, while the latter is much larger, but shallow and unnavigable. At the time of my visit there were two dredgers in the harbour, and I was informed that West Bay was to be deepened throughout and set apart for a man-of-war anchorage, and that new Government offices were to be built on the north-west side of the inlet overlooking West Bay. The latter are very much needed, for at present they are scattered about the town, which consists of a collection of heterogeneous buildings, setting all sanitary laws at defiance, with streets and alleys in the worst possible condition. I was very much surprised at the neglect of these thoroughfares, but I had not then seen the streets of the principal cities of Eastern Siberia. To the east of the town are the arsenal

PORT ARTHUR

and Government workshops and stores, and on the opposite side of East Bay there is a dock of considerable size. The railway enters the town at the extreme west end, and at the terminus there is a row of sheds for locomotives. The red-brick station was all but completed, and on high ground to the east of the terminus were the offices and residences of the officials of the Chinese Eastern Railway — the most imposing buildings in the town. Between the railway and higher ground to the west there is a large expanse of marshy ground which used to be flooded at high tide, but is now separated from the sea by a dam. The whole of this space, many acres in extent, is to be filled in and utilised. There is a branch of the Russo-Chinese Bank, besides several foreign stores, in the town. The hills overlooking the entrance channel bristled with forts, as also the spit of land above referred to, and I was informed that there are many more batteries on the hills than meet the eye, and that the place is impregnable; but I assured my Russian informants that I was no judge of these matters.

From Port Arthur I wished to make a trip to the site of the projected new town of Dalny in the south of Ta-lien-wan Bay, the laying out of which is in the hands of the railway company, and I called upon the chief engineer at Port Arthur with a view of getting a passage in the railway launch which runs between these two places. He received me courteously, but regretted that owing to bad weather the launch was not running with regularity, and he

MANCHURIA

could not say when the vessel would again leave Port Arthur. Under the circumstances I resolved to leave next morning for Newchwang, and he readily acceded to my request for a passage by train, and added that the car would be at my disposal from Newchwang northwards to T'ieh-ling.

I learned from other sources what was being done at Dalny. A plan of the streets, etc., of the town had been drawn up and submitted for the approval of the Russian Minister of Finance, to whom the railway company is responsible; water-works and electric lighting were well in hand; residences had been built for the engineers; and a large hotel was almost completed. The lots would in due course be put up to public auction at reserved prices contingent on the expenses incurred by the railway company, and the highest bidder, no matter what the nationality, would be declared the buyer or lessee.

I left Port Arthur next morning at 6.50 o'clock, stayed overnight at Nan-wa-fang-tien, and arrived at Newchwang at 6 P.M. on the 13th of April. It would be unfair in the present incomplete state of the line to pass judgment upon it, even were I competent to do so; but this much I think I may safely say. Although stone ballast was being prepared where rock cuttings had been found necessary, the line throughout is practically unballasted; the bridging, as we have seen, is far from complete, and I am of opinion that at least two years must elapse before the line will be able to bear heavy and regular

PORT ARTHUR

traffic. With regard to the materials, I had better quote the statement of an expert: "The rails weigh 64 lb. per yard and are 35-foot lengths. The joints are peculiar, being made with plain angle fishes on the inner side and deep angle fishes on the external side. The lower portion of the deep fish plate is greatly cut away, owing to the sleepers being spaced very close at the joints, so as to carry a bearing plate under the fish plate end. The bearing plates are punched for one single-head dog-spike on the inside, and two double-head spikes on the outside, one of these passing through a notch in the fish plate. The fishes are held by four bolts, with cup-heads and hexagon nuts, passing through pear-shaped holes, the two minor bolts being screwed up from the outside, the other ones from the inside. The other sleepers are secured by one spike only."

The sleepers, I was informed, spaced 30 in. centre to centre, but in practice I found them much closer. The size is 8 ft. 2 in. by 9 in. by 6 in., but the length, I was told, should be 8 ft. 9 in., the shorter lengths being bought hurriedly of a size in use in the Japanese lines. Most of the sleepers are of Japanese timber. They are credited with being good stuff, but I cannot say they impressed me favourably. Far too great an allowance in the "wane" had been permitted, and scarcely any I saw on the line actually laid were sound throughout, many shelling away in their lateral plane, while still more had broken or split from the dog-spikes to half, three-quarters and sometimes their entire length,

MANCHURIA

and only needed the passage of a few trains to fall apart.

The engines (compound Baldwin locomotives, built at Philadelphia) weigh 85 to 90 tons (a heavy engine for the weight per yard of rail adopted on this line). The cylinders are 13 in. and 22 in., driving wheels 52 in., and the engines have eight wheels, coupled with a leading two-wheeled bogie.

The scenery in the Liao-tung Peninsula is pretty among the hills south of Hsiung-yao, although there is little wood, and from the railway there is a charming view of Ta-lien-wan Bay and of the sea dotted with islands in the extreme south-west. I was too early to see signs of cultivation, for, although ploughing was proceeding, the streams were covered in the morning with films of ice.

Sir D. Mackenzie Wallace, in his excellent book on Russia, says: "In conveying passengers at the rate of from fifteen to thirty miles an hour the railway companies do at least all that they promise; but in one very important respect they do not strictly fulfil their engagements. The traveller takes a ticket for a certain town, and, on arriving at what he imagines to be his destination, he may find merely a railway station surrounded by fields. He finds to his disappointment, that the station is by no means identical with the town bearing the same name, and that the railway has fallen several miles short of fulfilling the bargain as he understood the terms of the contract. Indeed, it might almost be said that, as a general rule, railways in Russia, like

PORT ARTHUR

camel-drivers in certain Eastern countries, studiously avoid the towns. This seems at first a strange fact. It is possible to conceive that the Bedouin is so enamoured of tent life and nomadic habits that he shuns a town as he would a man-trap; but surely civil engineers and railway contractors have no such dread of brick and mortar. The true reason, I suspect, is that land within or immediately without the municipal barrier is relatively dear, and that the railways, being completely beyond the invigorating influence of healthy competition, can afford to look upon the comfort and convenience of passengers as a secondary consideration." As in Russia, so in Manchuria: the railway avoids the most important towns, but the reason is quite different, and is capable of easy explanation. One of the articles of the agreement entered into between the Chinese Government and the Russo-Chinese Bank for the construction of the Manchurian railway stipulates that, in laying down the track, cemeteries, villages, and towns must be avoided.

I have already explained how my journey northwards through Manchuria was blocked on my return to Newchwang, and I accordingly left that port by steamer on the 17th and reached Shanghai on the 21st of April, where I ascertained that the *Kiukiang*, a British steamer belonging to the China Navigation Company, was about to sail for Vladivostock by way of Tientsin, where she was to ship coolies for work on the Manchurian railway in the provinces of Kirin and Hei-lung-chiang. We took

MANCHURIA

passage by her, and, leaving Shanghai on the morning of the 27th, anchored outside the Taku bar on the 30th. Owing to a dispute as to the number of railway coolies the steamer could accommodate, the Tientsin agent of the steamer asserting that there was room for a thousand, while a Russian doctor who boarded and measured the vessel maintained that there was space for only four hundred and fifty, we did not sail for Vladivostock until daylight on the 4th of May, the number of coolies certified by the Russian doctor and the doctor himself having been received on board the previous evening.

The town of Vladivostock, in lat. $43^{\circ} 6' 51''$ N. and long. $131^{\circ} 52' 44''$ E., lies at the south of the peninsula between Ussuri and Amur Bays. It is approached through the Eastern Bosphorus Strait (Hamelin Strait), which divides the peninsula from a group of islands to the south. At the south-west end of the peninsula a channel with a lighthouse and signal station on a small island at its entrance leads northwards from the strait to a magnificent landlocked harbour stretching for miles to the eastward and known as Zolotoi Rog — “the Golden Horn.” Ascending the channel we passed guns mounted on the hills on both sides, and on the west, as the Golden Horn is neared, quite a number of suburban residences and a pretty little church. Higher up we were ordered to anchor at the quarantine station and were boarded by the health officer; but as the coolies were in charge of a Russian doctor no exami-

JAPANESE FUGITIVES ARRIVING IN PORT ARTHUR

PORT ARTHUR

nation was held, and the captain was directed to proceed to the wharf of the Chinese Eastern Railway Company early next morning and discharge his living freight. It was now evening, and the electric and other lights began to peep out from the hillsides ahead, showing the position and extent of the town of Vladivostock, which, facing south, clings to the lower face of the hills bounding the Golden Horn on the north from Amur Bay to the eastern end of the Horn. From a distance it looked like Hong-Kong; but a closer inspection revealed an immense difference. Next morning, the 10th of May, we ran alongside the wharf on the opposite or west side of the channel which is connected by rail with Vladivostock, and, with the assistance of half-a-dozen soldiers, the coolies, to all appearances content with their lot, were counted like so many sheep, landed, and entrained with others who had arrived the same morning in a larger British steamer, the *Glenshiel*, in covered trucks for conveyance to Nikolsk and across the Manchurian frontier. Round loaves of bread packed in bags, which had been piled alongside the track, were thrown into the trucks and scrambled for by the passengers, and off steamed the train. The coolies informed me that they had no fixed daily or monthly wage, that they were to work by the picce, and that they were to receive one *tiao* (100 large copper cash) for raising a bank of earth ten Chinese feet square and one foot in depth. As these men were engaged in Tientsin, I presume that the *tiao* in which they were to be paid is the *tiao* of

MANCHURIA

Northern China, for in Manchuria the *tiao* has quite a different value. In Newchwang, for example, it is 160 large cash, and from five to six go to the Mexican dollar, whereas in Kirin the latter is worth only two. In other words, the *tiao* varies in cash value in different parts of Manchuria.

After discharging the coolies our steamer proceeded to the anchorage for merchant vessels, which is situated in the western end of the Golden Horn, to land her cargo of brick-tea, flour, piece goods, ironware, and other miscellaneous articles, and, through the kindness of Messrs. Clarkson & Co., an American firm and agents for the steamer, we were soon installed in fairly comfortable quarters in the Hotel Moscow. These, however, were not procured without a little struggle, for the proprietor of the hotel at first met us with the word *Niet*, which means "No," "No room," "Nothing," "Not"; but the gentleman who accompanied me advised me to leave the matter with him and it would be all right. It *was* all right the same afternoon, and I soon learned that *Niet* in Russia does not necessarily mean "No," and that ways and means can usually be found to convert the negative into an affirmative. In England one is apt to take "No" seriously and as final; but in Russia we soon learned to receive *Niet* with a smile.

Hearing that the mail steamer on the Amur would not start from Habarovsk until the 17th of May, that the hotel accommodation in that town was very poor, and that steamer tickets could not

PORT ARTHUR

be procured until the vessel was on the point of sailing, we resolved to stay in Vladivostock until the morning of the 14th, and thus leave a clear day and a half at Habarovsk to arrange our passage westwards across Asia. The greater part of Vladivostock is built of wood, but many of the more recent buildings are of brick, such as the splendid lofty blocks of Messrs. Kunst & Albers, the great German bankers and storekeepers of Eastern Siberia. I say German advisedly, for one of the partners is, I understand, a naturalised Russian. I found this firm most obliging, and, although I was a perfect stranger, I was most kindly favoured with a letter of introduction to their agent in Habarovsk, praying him to afford me every assistance in his power.

A short ascent from the Custom House through the bazaar or market-place, where fruits and vegetables were exposed for sale, principally by Chinese, leads to the main street of Vladivostock. It runs east and west, west through the business quarter and across the railway track to Amur Bay, and east past Government buildings. Between the street and the sea, and on rising ground, are the residence of the Commandant of the port, with the Admiralty Gardens below, the Museum of the Geographical Society, the residence of the Governor of the Primorsk, the offices of the Commandant, a beautiful granite monument surmounted by a bronze globe, on which perches an eagle with outspread wings, to the memory of Admiral Nevelski for his voyages in the "fifties." Let into the pillar and facing the

MANCHURIA

Golden Horn is a bust of the gallant admiral; on the opposite side is the stern of the transport *Baikal* tossed on a stormy sea, all worked in metal; and on the other two sides are tablets recording his deeds. Further east are the Naval Club and Library, the new Admiralty buildings, the Dock, and the Naval Barracks and Hospital. The most prominent public buildings on the north side of the street are the Post and Telegraph Office, the offices of the Municipal Council, and the Cathedral of the Holy Virgin. To the north and south of this street, in the western quarter of the town, are merchant houses, banks, and the railway station. But what surprises one in Vladivostock is the condition of the streets. These are wide enough, and in places adorned with rows of trees, but the narrow wooden pavements, here and there dilapidated, afford excellent pitfalls for unwary foot passengers, and as you are driven along the main street at full speed by the *izvoshchik*, with his miniature broad-brimmed silk top hat and velvet tunic, you naturally grasp the side of the carriage to avoid being thrown out, and one day, driving in one of the principal streets, I was positively thankful that I had escaped destruction. One monument I have omitted to mention. In the quiet thoroughfare leading from the Government landing-stage to the main street is a gaily painted and gilded solid archway, erected for the passage of the present Czar (then Czarevitch) when he visited Siberia in 1891. On a conical hill behind the town rises a small red-brick tower — the fire-signal

PORT ARTHUR

station — where, owing to the inflammable nature of the majority of the buildings, careful watch is always kept. From this hill the view of the Golden Horn is magnificent. Below lies the merchant shipping, and away to the east stretches a fine expanse of water, in which I counted as many as thirty red iron buoys for mooring the Russian fleet, and in the middle of the Horn there is a large floating dock. But all this is closed by ice from November to March, when entrance and exit can only be had by means of an ice-breaker.

The population of Vladivostock, exclusive of the military and naval forces, is said to amount to 30,000, and consists of Russians, Chinese, Koreans, and Japanese. I do not enumerate the sprinkling of Germans, Americans, British, and others, who are practically a mere handful of the populace. The Chinese are shopkeepers, artisans, domestic servants, boatmen, and labourers, and as artisans they are, owing to their steady habits, much preferred to the Russians. The Koreans are mostly dock-labourers engaged in loading and discharging merchant vessels, while the Japanese are shopkeepers, clerks, and labourers. I was told that the military forces in Primorsk numbered from 60,000 to 80,000; but this was later discounted by a Russian officer to 54,000 men with coming drafts of recruits. The Chinese in their own country among themselves and in foreign employ undoubtedly possess and practise a code of manners however formal it may be; but in the towns of Eastern Siberia, where they are kissed

MANCHURIA

one day and kicked the next, it is hardly surprising that they lose their manners and become rude and independent. Such, at least, is the impression which they made upon me, and I was informed by a gentleman of considerable experience that, as domestic servants, they would suddenly leave their employment without any warning whatever.

The next step on our homeward journey was to reach the Amur, and this was easily accomplished by taking train from Vladivostock to Habarovsk, a distance of 716 versts, or about 477 miles. Two passenger trains leave Vladivostock daily, the mail train, carrying mails and passengers only, in the morning, the other, a mixed train, in the afternoon. We left on the morning of the 14th of May, and arrived at the Habarovsk station early in the afternoon of the following day. The actual time occupied on the trip was twenty-seven hours and fifty-five minutes, including stoppages of three hours and fifty-seven minutes, an average running speed of thirty versts, or twenty miles an hour. Everything on this section of the Trans-Siberian Railway was carried out with due precision: there was a buffet-car on the train, which was made up of most comfortable corridor carriages of four classes, costing roubles 17.00, 10.20, 6.80, and 5.41 per ticket according to class; at every station a bell hangs at the main entrance, and immediately the train arrives the bell is rung once, a few minutes afterwards (the interval being dependent on the length of the stoppage, which is carefully marked on the time-table between

PORT ARTHUR

the times of arrival and departure) it is rung a second time as a warning to passengers to take their seats, and two or three minutes afterwards the third bell goes, the guard blows his whistle, the engine replies, he blows a second time, the engine replies with a longer blast, and the train is off. This system prevails throughout the whole of the Siberian Railway. Although there was a buffet-car on the train at which meals could be had *à la Russe* or *à la carte*, many passengers preferred, doubtless for economy's sake, to satisfy themselves at the station refreshment-rooms, of which, including Vladivostock and Habarovsk, there are eleven along this section of the line. The stoppages ranged from four to fourteen minutes, the longer stoppages occurring at the refreshment stations. The Vladivostock-Habarovsk Railway, which is a single line throughout, is divided into two sections, known respectively as the South and North Ussuri. The present Czar cut the first sod of the former, which runs north from Vladivostock for 382 versts, on the 31st of May, 1891, and it was opened to traffic on the 13th of February, 1896. The cost of the permanent way was 19,117,229 and the rolling stock 1,466,280 roubles, a total of 20,583,509 or 53,884 roubles per verst — over \$40,000 per mile. The country around Vladivostock is hilly and wooded, with little cultivation, and it was only after we had rounded Amur Bay and approached Nikolsk or Nikolskoe (102 versts) that signs of tillage became apparent. Here Russian peasants were ploughing with teams of

MANCHURIA

oxen and ponies, but the farmhouses, if I may call them so, were wretched hovels, much worse than Chinese. The soil was a black loam, said to be well adapted to wheat cultivation, and small flour windmills were dotted about. The Government are giving every encouragement to emigrants from Russia to settle in the Ussuri region; but we found later that many of our fellow-passengers on the Amur were immigrants who had left their settlements in disgust, so that the attempt can hardly be called an unqualified success.

The town of Nikolsk lies half a mile to the west of the railway, and presented a very imposing appearance in the distance. The station, at any rate, was a scene of considerable bustle, Chinese, Koreans, and Russians jostling one another on the platform. It is the junction of the South Ussur and Manchurian lines, and the latter runs for a couple of miles parallel to the track of the former before it goes west to the Manchurian frontier, 110 versts distant. The Manchurian line was open for passenger traffic for ninety-one versts as far as Grodekovo, named after the present Governor-General of the three Trans-Baikal provinces, and for construction trains for another fifty versts. The total cost of the line from Nikolsk to the frontier is placed at 8,046,867 and 811,120 roubles for permanent way and rolling stock respectively. I may say here that many of the stations on the Ussuri line are named after prominent engineers and other officials. North of Nikolsk the country is well

PORT ARTHUR

wooded with birch and scrub-oak. Further north the track lies over low ground liable to inundation. This country lies to the east of Lake Hinka (called by the Russians Hanka), the northern part of which belongs to China, the southern and much larger part to Russia. There are two important bridges on the South Ussuri line — the four-spanned iron bridge, 252 feet long, across the Lefu, 156 versts from Vladivostock, and the large three-spanned iron girder bridge, 780 feet long, across the river Ussuri, after which the railway is named. The latter is 328 versts from Vladivostock, and the station of Ussuri lies one verst to the south of the river. At verst 382 from Vladivostock we entered on the North Ussuri line, and at verst 387 reached Iman, a station three versts south of the Iman River, a tributary of the Ussuri. The Iman River has sufficient depth of water to be navigated by steamers. Goods from Vladivostock, such as kerosene, etc., intended for the Amur regions are landed here, and carried down the Iman and Ussuri at rates cheaper than by rail to Habarovsk, and much of the railway material and plant for the Trans-Baikal section of the Siberian Railway came this way. The girder bridge across the Iman measures 840 feet. The North Ussuri line was begun on the 15th of July, 1894, and opened to traffic on the 13th of November, 1897. Including the extension from the Habarovsk station to the Amur, a distance of five versts, its total length is 339 versts. The cost of the permanent way and rolling stock was 20,365,033

MANCHURIA

and 2,093,846 roubles respectively. The Bikin River, an important tributary of the Ussuri, is crossed at verst 495 by an iron girder bridge of two spans measuring 560 feet in length, and three versts to the north of the river is the station of Bikin. Here the track passes through a well-wooded country, birch and pine predominating, with evidences of recent forest fires. Wild yellow flowers were peeping out from the underwood, and mistletoe was growing luxuriantly high up in the birches; but there was hardly a sign of bird life. At verst 638 from Vladivostock we crossed the Khor River, another tributary of the Ussuri, by an iron girder bridge of four spans, measuring 280 feet in length. Wherever the railway passes through forest, split logs of birch and pine were stacked alongside the line for consumption on the locomotives, which are all wood burners. Coal of an inferior quality is found to the north of Vladivostock, and I was informed that it is being tried on the part of the Nikolsk-Manchurian line now open to traffic. The track, which, since the passage of the Ussuri, had more or less closely followed the right bank of that river, takes a curve east and west over the plain crossed by the Khor and Kiya Rivers on their way to the Ussuri for a distance of about fifty versts, when it again approaches and follows it to its junction with the Amur. The Kiya is crossed by an iron bridge of four spans, 840 feet long. At verst 679, or nineteen versts from the station of Habarovsk, a branch line six and a half versts long leaves Krasnaia-

PORT ARTHUR

Retchka and goes west to the Ussuri for the convenience of the Chinese Eastern Railway Company. Material for the Trans-Manchurian Railway is thus carried to the Ussuri, whence it finds its way by steamer and barge to the Amur and up the Sungari to Harbin. Soon after leaving Krasnaia-Retchka we caught sight of the town of Habarovsk to the west and the Amur beyond, and we steamed into the station at schedule time, only to find that we had still a three versts drive to reach the town. Piling our baggage on a wooden skeleton framework on four wheels, we got into another open carriage and drove to the house of Messrs. Kunst & Albers. At my request Mr. Prella, the manager, who was kindness itself, sent one of his Russian employés with us to the best hotel, and promised to call later and do all in his power to assist us. At this hotel and at the other two hotels in the town we found the available accommodation so uninviting, not to say disgusting, that we returned in an hour's time to Mr. Prella, who received us with a knowing smile. He understood the situation thoroughly, and he was a man of resource. A new hotel was being built, it was still in the hands of the painters and devoid of furniture, but he prevailed upon the proprietor to let us have one of the rooms, which was, of course, luxuriously clean, and provided us with a couple of iron bedsteads and a sofa. We had already laid in a stock of canned provisions against accidents; but, pending some arrangement as to our future movements, Mr. Prella insisted on our joining his hos-

MANCHURIA

pitiable table. As, however, there was a mail steamer about to start up the Amur for Blagoveschensk, we did not anticipate any abuse of his hospitality.

Before leaving the Vladivostock-Habarovsk Railway I must say one word regarding it. So far as I am able to judge, it is well equipped in every way: it is well built, there having been few natural difficulties to overcome; there is abundance of rolling stock; there are twenty-two sidings in addition to the twenty-four stations, where the line is duplicated, affording great facility for through traffic; and, although I heard complaints regarding the slowness of the goods trains — three days being quoted as the time frequently required to cover the 477 miles — punctuality is certainly attended to in the case of the passenger trains. On the Nikolsk-Manchurian line, which is, as I have already stated, open ninety-one versts for passengers and goods traffic, the trains do not as yet exceed a speed of twelve miles an hour, the schedule time, exclusive of stoppages, being five hours and ten minutes. And one word of advice to those who would travel on Russian railways. Follow the Russian example and travel light. While a passenger may travel first class for a penny a mile, it will cost him a like sum for each pound weight of baggage which he carries in excess of the free allowance of one pood or 36 lb.

CHAPTER X

ON THE AMUR

HABAROVSK is a town of large area, scattered over three hills and the intervening valleys, and overlooks the Amur at its junction with the Ussuri. It is laid out on the American block system, with wide streets running north and south, and numerous cross streets with the usual narrow wooden pavements. Most of the buildings are of wood, but here and there in prominent positions red-brick blocks are springing up — the residences and offices of Government officials. The population amounts to 16,000, exclusive of the garrison, which numbers anything from 2,000 to 3,000 men. There is a considerable number of Chinese, who are preferred as carpenters and artisans generally. They are also small shopkeepers, and at street crossings tiny wooden erections, like railway ticket offices, have been run up where they dispense matches, kerosene oil, fruit, and other articles. I stopped at one of these places to invest in a box of matches, and the lad in charge was quite overcome when I named my wants in his own tongue. Instead of at once supplying me he hastened to inform his partner in my hearing, “Come, here is a

MANCHURIA

foreigner who speaks Chinese," and it was only after I had answered many questions, not only about myself but also regarding the probabilities of the death of the Emperor of China, of which they had heard report, that I secured my box of matches. I was an object of curiosity every time I passed that shop, and I gather from this that very few foreigners in Habarovsk speak Chinese. Many fish-skin Tartars (Yü-p'i-ta-tzŭ) live in the neighbourhood, but, as they visit the town only during the winter, we were denied a sight of this interesting people. We witnessed a Japanese funeral, which was attended by about fifty Japanese men who walked bareheaded in procession past our quarters. They all wore European clothes and appeared to belong to the better class. We saw several Russian processions, composed of men, women, and children, preceded by a horseman with bared head. Following the horseman were a primitive instrumental band, banners held aloft, several priests chanting, and a motley crowd bringing up the rear and joining in the chorus.

Although there was little evidence of any great trade, we noticed many good shops, some of them displaying in their windows the latest European fashions, others beautifully finished *samovars*, and others, again, canned meats, vegetables and fruits, bottled preserves and boxes of candies. There are several factories, including a brewery, and aerated waters flavoured with every possible kind of fruit are a specialty of the town. Cattle and wheat are im-

ON THE AMUR

ported from Manchuria, and the latter is at present ground into flour by numerous windmills, but a large steam mill will soon be erected for the purpose. The public gardens occupy the sloping bank of the Amur, and are separated from the church and museum on the top of the slope by a wide plaza, which is used as a parade ground. Here, as in private gardens in the town, apple trees were in full blossom. To the south of the church is a lofty triumphal wooden arch, erected in honour of the visit of the present Czar in 1891. It spans the street leading down from the plaza to the bazaar and wharves on the bank of the Amur. To my mind, however, the most imposing monument in Habarovsk is the bronze statue erected in an elevated corner of the Public Gardens to the memory of Count Muraviev, who was Governor-General of the Amur in 1854-55. It stands on a fine granite pedestal, and the Count is represented bareheaded, with folded arms, holding in his right hand a partly unrolled scroll, and gazing calmly across the Amur, the scene of his triumphs. At the junction of the Amur and the Ussuri, where there are many low wooded islands, a distance of five versts separates the Primorsk from Manchuria; but, after the junction, the Amur narrows to about two versts as it proceeds on its altered course northwards. From Habarovsk to Nikolaevsk navigation was still closed, and the river would not be free of ice for about a month. Vessels drawing ten feet can ascend the Amur from its mouth to Habarovsk during the five months in which naviga-

MANCHURIA

tion is open, and it was reported that a Russian gun-boat was expected to visit the town during the year.

Although Habarovsk is the seat of the Governor-General of Za-Baikalskaia, Amurskaia, and Primorskaia, there was no special evidence of that militarism which is such a distinctive feature of Vladivostock. Whereas in the latter town every third foot passenger was either a soldier or a sailor, in Habarovsk I noticed only a few soldiers with fixed bayonets standing guard over individual convicts engaged in repairing the roads. At the time of our visit Governor-General Grodekov was absent on a tour of inspection of the water frontier of the Primorsk and Manchuria — the Ussuri River and Lake Hinka. Habarovsk itself is within the Primorsk province, which extends westward for about twenty versts beyond the town before it touches Amurskaia.

Our first visit after settling down on the afternoon of the 15th of May was to the mail steamer, which was due to sail up the Amur on the 17th. This was the second steamer of the season, the first having sailed packed with passengers on the 12th. We were very pleased with the little vessel and thought we were in luck's way — there being nine first-class cabins accommodating eighteen passengers, with a good upper promenade deck; but when we applied for passages we were at once face to face with the word *Niet*. The Mail Steamer Company is subsidised by the Government, who have the first choice of passages for Russian officers, and it is only after

ON THE AMUR

the Government are satisfied that any remaining vacancies can be allotted to outsiders. On the present occasion the Government had taken up the whole of the steamer for officers proceeding to Blagoveschensk on topographical duty, and we should have to wait for the next mail steamer leaving on the 22nd. Fortunately, however, there are other steamer companies on the Amur, and on the 16th Mr. Prelle rushed in and informed us that a steamer had just arrived from up river and would leave the same night. We hastily bundled up our traps, and in company with Dr. Gelpcke, a German judge from Kiao-chow, who was proceeding home by this route, boarded the *Neronov* at 8 P.M. As soon as we got on board the struggle for accommodation began. There were only three small cabins, two of which had already been secured by Russians. Two Russian captains occupied one, while the other was secured by a Russian engineer officer and his bride. Mr. Prelle came to the rescue, and prevailed upon the captain of the vessel to give up his cabin to my family while I slept in the saloon, and Dr. Gelpcke was given possession of the vacant cabin. We were all perfectly satisfied, and, had the fates been favourable, I am perfectly sure that we should have had a very comfortable trip as far as Blagoveschensk. Our passage tickets cost 18.36 roubles each, with a half ticket for my son, and we had to pay 6.44 roubles for excess baggage. This is exclusive of food supplied by the ship, which, being of the barest description, had to be supplemented by stores purchased

MANCHURIA

in Habarovsk. We got up anchor at 9 P.M., and ran alongside a couple of barges which we were to tow as far as Blagoveschensk, whence they were to be sent up to Stretensk to embark Russian recruits and remounts for cavalry in the Primorsk. We remained by the barges over night, and started up river at 4 A.M. on the 17th of May. The distance by river from Habarovsk to Blagoveschensk is $918\frac{1}{4}$ versts, which we expected to cover in four or five days; but, owing to a series of accidents which will be detailed later, we did not reach the latter town till the evening of the 27th. The Amur and the Shilka are marked, lighted, and in some places buoyed by the Russian Government, and two vessels are constantly employed during the open season in surveying the river, and, as the channel changes, in altering the marks. At all difficult crossings there are leading marks fixed on poles surmounted by oil lamps, red on the right bank, white on the left, which have to be kept in line to avoid grounding, for the shallowness of both rivers is remarkable, and necessitates the employment of paddle or stern wheel steamers only. And not only so, but the most of these steamers are simply tow-boats engaged in towing large barges of very light draught. They are all wood burners, and when the bunkers and the deck fore and aft are filled and piled with logs there is no possible room for cargo. Such was the *Neronov*, a strong iron paddle-wheeled vessel, with twin funnels, built by Armstrong, Whitworth & Co. in 1896. On leaving Habarovsk we zigzagged about from side

ON THE AMUR

to side of the river dodging islands, which are very numerous as far as the mouth of the Sungari, a distance of 241 versts. Here the banks of the Amur are low, and the land is densely wooded with short trees, such as willows and elms. Two hours after starting we stopped to load firewood at a wood station on the north or Russian bank. Along the whole course of the Amur and Shilka split logs of pine and birch are piled at intervals in long rows about seven feet high, and over these fly the flags of the different steamship companies. Immediately the steamer is moored alongside a wood station the crew are sent on shore, each couple provided with two long poles, near the ends of which wedges of wood are nailed to keep the logs piled on the poles from slipping off. On reaching the deck the loads are turned over, leaving a pole in the hands of each of the bearers. When coaling, if I may use the word, all the crew wear large leather gloves as a protection against wood splinters. To take in a full complement of wood occupies about two hours, and, as this has to be done once a day, the passengers have the opportunity of a daily run on shore. Our vessel was manned by a captain, mate, pilot, engineer, and staff of firemen, cook, carpenter, and some ten of a crew, four of whom were Chinese, and earned exactly the same wages (thirty roubles a month) as the Russian members. One of the most important duties on board was sounding: a piece of wood about two inches in diameter and iron shod at the thick and tapering to an inch at the thin end, to which a piece

MANCHURIA

of rope is lashed, is painted in foot lengths black, white, and red alternately along its whole length of eleven feet, and one of the crew was constantly on deck plunging it harpoon fashion into the river, retaining, of course, the rope in his right hand. When he struck bottom he shouted to the pilot the depth of water. Probably the hardest worked individual on board was the saloon boy, a Chinese lad of about eighteen years of age. He was everybody's servant: he attended not only the passengers but also the captain, mate, pilot, and engineer, and earned the modest wage of ten roubles a month and his food. He told me that he was born in Blagoveschensk, and was therefore, I presume, a Russian subject. He spoke Russian of a kind, but his Chinese was very poor, and we had some little difficulty in understanding each other. He was, however, all anxiety to attend to everybody, and always turned up with a smiling face. He had the objectionable habit of mixing up the table-napkins, to which he appeared to be little accustomed, and he was not distressed if the piece of white waxcloth which did duty for a table-cover remained stained for days. In fact, we had said good-bye to cleanliness, for there was no bathroom on board, and the sanitary arrangements, though very imperfect, were much superior to what we experienced later. The ship's meals were: breakfast at eight o'clock, consisting of bread and tea *à la Russe*, and dinner at noon, made up of soup (usually cabbage) with chunks of beef in it, to which the passengers helped themselves from the tureen,

ON THE AMUR

and which they were expected to cut up and devour after finishing the soup in their plates. This was followed by a meat dish, usually beef cutlets or hash, and the inevitable tea. A glass of tea could be had at four o'clock, and supper, consisting of one meat dish (always beef), was served at six o'clock, with more tea, which seems indispensable at every Russian meal and at all odd times. The preparation of tea in Russia is somewhat peculiar according to our ideas. A few pieces of burning charcoal or chips of wood are dropped down the funnel of a *samovar* into the small furnace at the bottom, the *samovar* having previously been filled with water, which surrounds the metal chimney. There is a considerable draught upwards from the furnace, which is open metal work, and it can be increased by the addition of an extra funnel with a small wooden handle. The little fire glows, the smoke disappears, the water boils, and the steam appears at a small opening in the top of the *samovar*. At the bottom of the *samovar* there is a tap for allowing the boiling water to escape when required. A tea-pot is now filled with tea leaves and boiling water poured over them. The infusion, as might naturally be supposed, is very dark in colour and very strong. It has, therefore, to be reduced. A little of what I may call the essence of tea is now poured into a tumbler, much or little according to the taste of the drinker, and the glass is placed under the tap of the *samovar* and filled up with boiling water. This is Russian *chai*, and sugar and a slice of lemon (if procurable) are

MANCHURIA

added, but no milk or cream. We found it refreshing at first, but soon got very tired of it. The Russian, however, makes it a medium for mixing claret, brandy, *vodka*, or any other wine or spirit that may be at hand.

We had accomplished about 100 versts from Habarovsk when, at 9.30 P.M. of the day of our departure, we ran full speed into a sand spit projecting into the river from the Russian bank. There is a sharp bend of the river at the spot, and the pilot had tried to round it too soon. The result was that the *Neronov* was hard and fast. Every steamer on the Amur carries a couple of long spars pointed and shod with iron at the thin end, with a cross piece through the spar near the thick end. When a vessel grounds and reversing fails, one of the spars is dropped point downwards in a perpendicular direction into the shallows, the thick end with the cross piece rising above the deck. A chain with a pulley is adjusted round the cross piece and attached to a noose fastened round the bits near the bows. The pulley chain is then passed round the capstan, and as the latter revolves the spar is either pushed into the sand or the vessel is raised. If the first spar is only partly successful, it is kept in position, and the second spar goes overboard and is similarly manipulated. Clumsy as the method looks, I have seen it fail in only one of the many occasions on which it was our misfortune to witness its employment later. The solitary failure was the *Neronov*, for, although the crew worked half the night and all next morn-

ON THE AMUR

ing, she would not budge an inch, while sand was meantime making all round her. There was no help for it but to await a tow from one of the same company's steamers. During the day we met four Russian steamers towing barges whose decks were crowded with horses, the steamers themselves being packed with Russian officers, who always travel in uniform. We had passed a tow-boat flying the flag of the Chinese Eastern Railway Company with two large barges heavily laden with railway materials bound for the Sungari and Harbin. On the afternoon of the following day (the 18th) the *Nerchugan*, a steamer belonging to the same company as the *Neronov*, came down the river with a large barge packed with horses and recruits, and, after finding a safe anchorage for her barge, stood by to render us assistance. She made three desperate attempts to tow us off, but failed, and in the end picked up her barge and proceeded to Habarovsk. We were now told that all hope of getting the steamer off was abandoned for the present, and that we would be taken on to Blagoveschensk by the company's first up river steamer, probably the *Nerchugan* herself. The bride and bridegroom were too happy to care about the delay; but the other passengers, and especially we ourselves, who had hoped to be among the first Britishers to pass over the recently completed Siberian Railway, were not, I fear, blessed with the same equanimity. During this enforced idleness I had several interesting conversations with one of the Russian captains, in one of which

MANCHURIA

he assured me that within five years Harbin would be a Russian town, just as Pretoria would soon be British. Curiously enough, the former is now in Russian military occupation, and the British flag has been hoisted in the latter. Early in the morning of the 20th of May the steamer *Admiral Nevelski* arrived from Habarovsk with a view to assisting us; but, seeing that our position was hopeless, she turned round and returned without making any attempt to tow us off. Steamers passed up and down, some with barges laden with locomotives and girder bridges for the Manchurian Railway, others with passengers to and from Blagoveschensk, and day after day our eyes were strained to catch sight of the smoke of the *Nerchugan*, while *parahod nict* (no steamer) became a by-word among the passengers. It was not, however, till noon of the 21st that the captain of the *Neronov* assured us that the steamer was actually in sight, and it was with a feeling of relief that we found ourselves soon afterwards on the deck of the *Nerchugan*. She was already full of passengers, sixteen in all; but accommodation, more or less comfortable, was found for the stranded eight. We were fortunate in having the first mate's cabin assigned to us — a comparatively large room with one bed, but ample floor space for sleeping; the youthful couple got the steward's cabin; the engineer shared his room with one of the Russian officers; and the other two were placed in the forehold. Seven of the sixteen passengers were British, some of them old friends.

ON THE AMUR

The transfer of the baggage and of one of our barges was effected at 3 P.M., when we once more started up river.

Along the whole of the north bank of the Amur Cossack stations have been planted from time to time at intervals varying from ten to thirty versts. They are simple clearings in the forest, and no attempt at cultivation on a large scale has been made. Gardens there are, but even they are small and ill-kept. There is, however, abundance of pasturage in the forest, and cattle-rearing is universal. At every station there are fenced stockyards, where the cattle are rounded up for the winter. As a rule, a station consists of a few streets of log huts, with a large white-painted wooden church, surmounted by domes and minarets, usually of a green or purple colour, which vary in number according to the wealth of the population. During the winter the men devote themselves to hunting and felling timber for the steamers, and the entire absence of means of communication may account for the dearth of agriculture. True, at every station at which we stopped women and girls clad in gaudy skirts and wrappers, with shawls over their heads, crowded the river bank, carrying farm produce of all kinds for sale. Bread, milk, eggs, fowls, curds, butter, small oxen, calves, pigs, and on very rare occasions fish, could usually be had at very cheap rates. The Amur abounds with sturgeon and salmon, and yet I can recall only two occasions on which I noticed fish lines and hooks, and once, on the foreshore at Puzina,

MANCHURIA

I saw a huge sturgeon being cut up and disposed of. There is abundance of wealth in the Amur, but there is nobody to collect or consume it.

Between Habarovsk and Blagoveschensk there are about forty of these stations, with populations ranging from five to over a thousand souls, and very evenly divided between males and females.

At noon on the 22nd of May we passed the mouth of the Sungari, where a number of steamers and barges were at anchor. Hitherto we had been ploughing the waters of the Amur between low, densely-wooded banks, at times ten to twelve feet high, at others shelving to the river, and it was only when we approached Ekaterino-Nikolskaia that hills began to show themselves on the Manchurian side. At this station, which is 375 versts from Habarovsk, rafts were moored along the river face, and logs of pine were being dragged up the steep bank by horses and oxen. Beyond Ekaterino-Nikolskaia the river, which is half a mile broad above its junction with the Sungari, narrows considerably, and is hemmed in by low hills on both sides, for we were approaching the Hingan Pass, where the width of the Amur does not exceed 300 yards. Here the river has cut a passage through the eastern outliers of the Lesser Hsing-an Range, and for quiet, peaceful beauty it would be difficult to surpass the twilight picture of the dark river, hemmed in on both sides by elm and birch-clad hills 350 feet in height. Here and there patches of snow among the dense foliage, and blocks of blue ice at the water's edge,

ON THE AMUR

added to the charm of the scene. The small village of Hingan, with its few logs huts, scarcely ruffled the eeriness of the gorge. It was not grand. There is nothing on the Amur to equal the gorges of the Upper Yang-tsze, which rise several thousand feet sheer up from the river, and inspire awe in the breast of the traveller below. The scenery on the Amur is of a different type. Hills densely clothed with elms, pines, and birches there are, with an occasional lofty crag overlooking the river; but want of life, especially on the Manchurian side, is apt to make the forest weary and monotonous. In the lower reaches of the Amur, however, the woodcutter has been hard at work and denuded the banks of pines, with the result that wood for the steamers has to be floated down from the upper reaches at double the original cost.

Steamers on the Amur between Habarovsk and Blagoveschensk usually draw between three and four feet: it is not safe except during the rains in July and August to load a vessel beyond that draught. In the narrow Hingan Gorge we had soundings of ten feet; but taking the lower river as a whole it is extremely shallow. Large roots of trees stranded on sand-banks high above the water level gave an indication of the rise during floods.

After issuing from the Hingan Gorge, and before arrival at Pompeevka, we passed a Chinese gold-mining camp on the Manchurian side. This I learned from Chinese at Raddevka is T'ai-p'ing-k'ou, and exactly opposite Raddevka itself is the camp of

MANCHURIA

Kuan-yin-shan, lying at the foot of a hill some 600 feet high, with a temple of Kuan-yin half-way up its face. Two gilt-topped red poles in the camp denoted the residence of a Chinese official who acts as superintendent of the mines. At Raddevka some uniformed Chinese soldiers had under arrest a miserable coolie who had stolen gold and escaped across the frontier. He had been discovered and handed over by the Russians, and was in all probability about to undertake his last passage of the dark Amur, for in these remote corners of Manchuria there is little ceremonial observance, and punishment is swift and sure. At Raddevka, which we reached at eight o'clock on the morning of the 24th of May, we found cherry and other fruit trees in full bloom, and there was a wealth of purple azaleas on the hill behind the log village, while the ground was in many places carpeted with wild strawberry plants. With flowers collected here the English ladies on board adorned a table which was rigged up on deck, and, having purchased the only three bottles of champagne on board, the English party invited the captain, officers, and the Russian passengers to join them in celebrating at noon the anniversary of Her Majesty's birthday. I am glad to say that they nearly all responded to the invitation, and after the necessary clinking of glasses the toast of long life to our beloved Queen was drunk with enthusiasm, followed by ringing cheers and "God Save the Queen." Our guests explained through an interpreter the pleasure it had given them to join us, and stated

ON THE AMUR

that their wishes for Her Majesty's long life were as fervent as our own. The simple ceremony had, in my opinion, the effect of bringing about a friendlier feeling between the Russian and English passengers. On board the *Neronov* we had each paid one rouble and a half per day for the ship's food, and on the *Nerchugan* the English passengers had arranged with the steward to pay two roubles a head per day on condition that a sweet should be added to the evening meal. Owing to the large number of passengers and the insufficiency of the saloon accommodation, meals had to be served at three different times, and, as there was only one Russian waiter for the whole company, it will be readily understood that much was wanting. Some of the passengers could not face the inevitable beef, and contented themselves with *zakuska* served at the bar, and consisting of snacks of caviare, fish, bacon, etc., and a glass of *vodka*, all for the modest sum of twenty kopeks. There was no bathroom, and anything beyond an ordinary wash had to be carried out under the pump.

At Pashkova, which is thirty-five and a half versts above Raddevka, the country on the Siberian bank of the Amur becomes flat and uninteresting, and continues so until Blagoveschensk is reached. The Chinese bank, on the other hand, is hilly and densely clothed with pines and birches; but, after passing Innokentevskaia, which possesses an exceptionally large and lofty church visible for some miles, the hills recede, till opposite the mouth of the Bureya

MANCHURIA

River hidden by an island at the entrance, they are distant several miles from the Amur. The captain was a very careful navigator, and although we had a pilot he never left the bridge except for meals. To enable him to get some sleep, therefore, we usually came to an anchor at about 10.30 P.M., and started again next morning at about 3.30. This, with about two hours required daily for coaling, reduced the day's actual running to some seventeen hours. Poiarkova, where we arrived at 7.30 A.M. on the 26th of May, was the most imposing place we had yet seen west of Habarovsk. It contained a large, gaily-painted church and quite a number of two-storied houses. The bank of the river under the town was strengthened with terraces of millet stalks to prevent it being washed away, and on the foreshore I counted fifty-six sleighs alongside a pile of bags containing oats, which had evidently been brought down river before the breaking up of the ice. Here both banks of the river, though flat, are densely wooded. There are two Chinese villages on the Manchurian bank, a few versts to the west of Poiarkova, and higher up on the same bank there is a very large wood station, where the river is broken up into several channels by islands. At the wood station a mail steamer and a tow-boat were moored; bags of oats had been discharged and piled up on the bank, and two herds of fine cattle were roaming on the foreshore. A conference of the steamer captains was now held, and, after over an hour's delay, we paid out a steel hawser to the tow-boat, which

ON THE AMUR

forged ahead and made for a narrow channel alongside one of the islands. So swift was the current that, with both steamers going for all they were worth, we took three-quarters of an hour to stem it. At times we seemed to be making no headway at all, the tow-boat yawing from side to side in her frantic endeavours to help us. During the ascent we bumped several times. This is undoubtedly the most difficult part of the river between Habarovsk and Blagoveschensk. Above the channel we found a large barge laden with cattle at anchor, and a very large herd wading in the river on the Russian bank. At Konstantinovka, which we reached at 4.30 p.m., we dropped one of our barges. The village lies about half a mile from the river, and is approached over wild, uncultivated downs, and between the downs and the street of log-houses, with a large church at the up river end, were gardens of considerable size. Oats were being discharged from a barge, and the women and girls hurried down to the river with curds, milk, eggs, and potatoes for sale. Here I learned that the potatoes in Siberia are grown from imported American seed. They are excellent in size and flavour. There was quite a crowd of Chinese, evidently passengers by the barge, sitting on the bank with their baggage piled around them. We moored for the night at Ssü-chia-t'un, a Chinese village on the Manchurian bank, where we took in firewood. We landed and found the people very civil, if inquisitive; they offered eggs and even Manila cigars for sale. There was a large admixture

MANCHURIA

of the Manchu element here, for there was no mistaking the headdress, clothing, and large feet of the women. The villagers, they informed us, devoted themselves to wood-cutting and horse-breeding, and we noticed a wood tax station, and in the plain behind the village a herd of horses grazing. There was no cultivation to speak of, and the only industry I observed was boat-building. We left Ssü-chia-t'un at 4 A.M. on the 27th of May, and from that village to Blagoveschensk we saw more life on the Manchurian bank of the river than at any other point along the whole course of the Amur. Village after village, with cattle, horses, and tents, dotted the bank, and at 8.30 o'clock we reached the southern end of the town of Aigun, where the treaty defining the northern frontier of Manchuria and Russian Siberia was signed in May, 1858. Aigun, which is distant forty-one and a quarter versts from Blagoveschensk, runs for a couple of miles along the bank of the river, and is separated from the camp and forts at its northern end by a dark belt of pines. It was a sleepy-looking place, and little did we think as we passed the straggling town that within a couple of months its garrison would have dared to attack the finest town in Western Siberia, and bring inevitable destruction upon itself. It is now in ruins, and a Russian column has traversed the road which leads from it to Tsitsihar, the capital of the Hei-lung-chiang province. The *Nerchugan*, which, by the way, is a wooden vessel built at Nikolaevsk, had some difficulty in negotiating the channel

A MANCHURIAN GIRL

ON THE AMUR

leading to Blagoveschensk. Just below the junction of the Zea with the Amur a long sandbank has formed on the Manchurian side, and we had the misfortune to hug the bank too closely and to run ashore. Meantime a heavy squall of wind and rain sprang up, and we had to let go our barge, which drifted a long way down the river, dragging her anchor. In the teeth of the gale the spars were dropped over the bows, and, after a struggle lasting several hours, the *Nerchugan* suddenly shot off the bank into deeper water, and drifted some distance before she could be brought to an anchor. We had again effected connection with our barge after considerable difficulty, when a large junk fouled the hawser, lay right across the bows of the barge, and was towed in that position till she was able to clear herself. At 7.30 o'clock on the evening of the 27th of May we dropped anchor on the left bank of the Amur opposite the town of Blagoveschensk, the journey from Habarovsk having occupied ten days and a half, four of which we were aground.

Blagoveschensk is built on the left bank of the Amur, and on the right bank of the Zea, and on the angle formed by, and to the north of the confluence of, these two rivers. It is spread over a very large area, with wide streets in comparatively good repair, and contains many magnificent mercantile houses. Although red brick is now taking the place of wood, it is really a fine example of the architectural value of the latter, and one is surprised to find signboards over what in this country might be readily taken

MANCHURIA

for palaces. As an architectural display it far surpasses Habarovsk and Vladivostock, and there is abundant evidence on every side that the town possesses much wealth. It is, as I have said elsewhere, the centre of the Siberian gold industry. The noble triumphal arch erected on the bank of the Amur in honour of the visit of the present Czar in 1891 befits the grandeur of the surroundings. The town is lighted by electricity, and on the night of our stay there it was *en fête*, and the streets and buildings were beautifully illuminated with fairy electric lamps in honour of Coronation Day. The population amounts to about 33,000, and there is a garrison of 5,000 infantry and 300 cavalry. There are three large hotels in the town, and, in spite of the word *Niet*, with which we were at first greeted, the whole of the English party and others succeeded in obtaining a footing in one of them, although we were warned that we were liable to be turned out at any moment by mail steamer passengers who had engaged the rooms by telegraph. We took the risk; but the negotiations lasted so long that it was midnight before I had my baggage transferred from the steamer. We had been informed on arrival that the passages by the mail steamer leaving for Stretensk in a couple of days were all booked, and, although one of our party had telegraphed from Habarovsk engaging the whole of the passenger accommodation in a steamer to connect with the *Nerchugan*, there was no steamer forthcoming on arrival at Blagoveschensk. In this connection I

ON THE AMUR

may mention that the Governor-General at Habarovsk had promised another gentleman of the party that he would telegraph to Stretensk to have a first-class carriage waiting for him; but the gentleman in question had actually to start on his railway journey in a horse-box! During the evening one of our Russian fellow-passengers informed us that he and some others had secured passages in a steamer called the *Vladimir Monomach*, which was to sail for Stretensk next day, and he promised to do his best for me next morning. Although the best he could do was the usual "*Niet*," several of us boarded the steamer early and succeeded in inducing the captain to take us, my quarters being a small room belonging to the pilot, who was persuaded to give it up for the sum of thirty roubles, with an additional ten roubles for the benefit of the ship. It was a bare room with only one bunk, and the floor accommodation was scanty for sleeping purposes; but several days after our departure the Russian fellow-passenger alluded to above insisted on exchanging rooms with us, he having secured a whole cabin with two bunks for himself. It was a kind act, for the pilot's room, although good enough for one, was totally insufficient for three. Four remained behind, determined to try their luck with the mail steamer, and in this they were successful, having bought out the captain and second mate for considerable sums. This and our after experiences taught us that the rouble can effect many things in Russia.

The village of Hei-lung-chiang, Sa-ha-lien, or Hel-

MANCHURIA

ampo, as it is variously called, lies on the right bank of the Amur, opposite Blagoveschensk, and it is here that the Chinese and Russian land telegraph lines connect. As I write, the following telegram from Blagoveschensk, dated 7th September, appears in the press: "A solemn thanksgiving service, attended by the principal civil and military authorities and a large concourse of people, has been held on the right bank of the Amur, on the site of the Chinese village of Sakhalin, now reduced to ashes. In commemoration of the capture of the village by the Russian troops, its name has been changed to that of Ilinskipost. The local pope, who officiated at the ceremony, delivered an address, in the course of which he said, 'The Cross has now been erected on the bank of the Amur which yesterday was in possession of the Chinese. Muriavieff Amurski foresaw that this bank would be ours sooner or later.'"

The distance from Blagoveschensk to Stretensk is 1,197½ versts, and is reckoned an eight days' journey by mail steamer under favourable conditions. As we were about to travel in an ordinary cargo steamer with passenger accommodation, we did not anticipate such speedy transit, and considered it advisable to lay in a goodly stock of provisions to supplement the not too sumptuous steamer fare. We soon found that luxuries in Blagoveschensk were at prohibitive prices. While Scotch whisky (labelled as such) manufactured in St. Petersburg and Russian brandy cost roubles 1.40 and 2 per bottle respec-

ON THE AMUR

tively, whisky manufactured in Scotland was not to be had, and French brandy cost seven roubles a bottle, and as much as nine in the hotels. Russian cigars were offered at sixteen roubles a hundred, and I was told that the customs duty amounted to nine roubles a box—much more than the value of the cigars themselves. We left Blagoveschensk at 10 P.M. on the 28th of May; but, previous to our departure, the first mail steamer of the season arrived from Stretensk, bringing very bad accounts of the shallowness of the Shilka and of the train accommodation between Stretensk and Irkutsk, and we were assured that unless the Shilka rose very considerably the *Vladimir Monomach*, which was drawing four and a half feet, could not possibly reach her destination. We were already too sick of struggling with adverse circumstances to care about trifles: we were glad to be on board a steamer of any kind. I have omitted to mention that excess baggage between Habarovsk and Blagoveschensk was charged at the rate of ninety-two kopeks a pood. There was quite a crowd of Russian and Chinese deck passengers on our new steamer (new to us, but in reality an old wooden tub), who rigged up planks and stowed themselves away in a very clever fashion. The Chinese brought their provisions with them, in the shape of round flat loaves of bread with holes in the centre, through which a string was passed: they were like strings of cash on a large scale. The sanitary arrangements were disgusting from an English point of view, and the water supply was primi-

MANCHURIA

tive and inadequate. A bath was entirely out of the question, and even in the hotel at Blagoveschensk, where we did expect to get a good wash, there was no bathroom.

Owing to a dense fog in the early morning, during which we had to anchor, the *Vladimir Monomach* did not arrive at Markovo, forty-four versts from Blagoveschensk, till 7 A.M. of the 29th of May. In the Lower Amur we had experienced a fairly high temperature during the day, while the evenings were chilly, and in the Upper Amur the extremes were still more marked. During the day and in the sun it was uncomfortably hot and shade was desirable; but it was frequently freezing overnight. Blocks of ice were stranded along the banks whereon wild roses were growing, and the bushy fronds of the peony were a foot above ground, while beyond on both sides low trees were laden with white blossom. Just beyond Bibikova, which is seventy-six and a half versts from Blagoveschensk, the river, some 800 yards wide, is bounded by green, flat-topped hills about 100 feet high, clad with low trees half-way up their sides, but as Busseva is neared they recede from the river on the Russian side. In the early part of the day a few huts here and there were visible on the Manchurian bank, and smoke was curling up from the dense forest, where woodcutters were doubtless at work. Many rafts of pine were met during the day manned by Russians, and on one I counted as many as nine working the sweeps. The captain always slowed down as we approached

ON THE AMUR

a raft, to save it from our wash. We moored for the night alongside a wood station, and coaled by the light of a fire of pine logs. It was showery overnight, but we were off again at 2.30 A.M. of the 30th. A steamer drawing three and a half feet, crowded with passengers, passed down in the early morning, and we took courage, for the *Vladimir Monomach* was drawing only a foot more. Here the scenery was very pretty: occasional cliffs rose from the river on the left bank, and steep, densely-wooded banks hemmed in the Amur on the Manchurian side. Birch was predominant. Every night we have had a magnificent display of fireworks. Showers of glowing sparks of charcoal shoot up from the steamer's funnel, and are reflected in their thousands ere they drop and are lost in the dark bosom of the Amur. During the day these burning sparks played considerable havoc with our clothes, and the whole of the vessel's deck and painted rails were scarred and charred by them. I have seen one of them drop down the neck of the man who was sounding, and cause considerable pain. Beyond Novo-Kumarskaia and opposite the mouth of the Kumara River, which enters the Amur on the Manchurian side, a large cliff some 200 to 300 feet in height, surmounted by a high wooden cross, rises sheer from the river. It is known as Amur Cliff, and was the scene of great enthusiasm when the present Czar passed in 1891. It was crowded with Cossacks, who cheered the then Czarevitch to the echo. In the evening we passed a still higher and more imposing

MANCHURIA

cliff on the Chinese side, and were asked to believe that the tiny trickle down its face is petroleum.

On the morning of the 31st of May, and before arrival at Ermakova, the banks of the river, which narrowed to about 200 yards, were piled with blocks of ice, and at one place in a bend on the Russian side a large part of the gravel bank had been freshly scooped out, evidently by glacial action. Soon afterwards a steamer towing a couple of barges laden with horses passed down river. These horses are, I understand, bred in a district to the west of Irkutsk. The principal entrance to all these Russian stations or villages is marked by a wooden archway, which is approached from the river by a staircase. At Cherniaeva, which we passed at 7 P.M., the archway was more elaborate than usual; it was wide and artistically roofed. Here signals giving the depth of water were posted, showing that shallows might be expected higher up, and next morning, between Vaganova and Tolbuzina, we grounded sure enough, and remained fast for an hour and a half while the cumbrous spar was brought into play. Two steamers, one drawing four and a half feet at the bows and three feet at the stern, passed down during the day, and our hopes of successfully reaching Stretensk in the *Vladimir Monomach* rose. Over night the mail steamer with our friends from Blagoveschensk caught us up and moored at the same wood station; but we were off before her in the morning, only to be passed a few hours later while we were struggling in a shallow part of the river. This did

ON THE AMUR

not add to our happiness, and when we grounded again a few hours later and the rain came down the social barometer fell considerably. It was little consolation to us to be able to pass a small Government launch towing fifteen small rowing boats up river. Here and there in sheltered nooks there were snowdrifts a couple of feet above the water level.

We passed Albazin during the afternoon. We had hoped to see in this place some historical monuments of the struggle which was carried on between the Russians and the Chinese from 1685 to 1689, when, by the Treaty of Nipchu (Nerchinsk), the Russian fortress built there was demolished, and Russian subjects withdrawn to Muscovite territory. We were disappointed. Albazin is a collection of poor-looking log shanties, and, although our steamer did not stop there, we saw all we cared to see from the deck. It appeared to be one of the poorest Cossack stations along the Amur. In contrast to Albazin, Reinova, which we reached the same evening, is a flourishing place. It has a good main street, with wooden pavement, running along the river bank, containing several good shops, where we were able to purchase cocoa, preserves, and other luxuries. It likewise boasted of a Post and Telegraph Office, and it was quite a surprise to hear a harmonium and even a gramophone at work. Here we met a number of Chinese, who informed me that they were on their way to some gold mines seventy miles to the north. Our cargo consisted of American flour, cement, brick-tea, and *vodka*, which its owner, who is also

MANCHURIA

owner of the vessel, was carrying to Stretensk as a venture. On arrival at Reinova he received a telegram from up river stating that there was only three and a half feet of water in the Shilka, and that our vessel could not proceed beyond Pokrovskaia. The Russian passengers were very indignant, and asked us to join them in bringing pressure to bear upon the owner, and I fear the poor man had a very unhappy time until we discovered that it would have been madness to attempt the ascent of the Shilka in the *Vladimir Monomach*. The bad news probably induced him to dispose of a goodly number of bags of American flour at Reinova. On the opposite bank there was a small Chinese camp with flags flying.

We arrived at Svirbeeva at 10.30 A.M. on the 3rd of June and anchored just above the village, when the captain and pilot proceeded up stream in a couple of boats to survey what was described as the worst crossing in the whole river. We spent a couple of hours on the wooded bank, where we discovered a couple of snakes, grey and black in colour and about two and a half feet long. I noticed that the Russians showed a great aversion to these creatures, standing at a distance with large stones in their hands, while a Chinese, who was one of the crew, went in with a stick and disposed of one of them, the other escaping and succeeding in concealing itself in the tall grass. The verdict was four and a half feet on the crossing, and we dropped down river to Svirbeeva, and, following the example of another

ON THE AMUR

steamer, discharged part of our cargo, lightening to three and a half feet at the bows and three feet at the stern. The cargo was dumped on the foreshore, a tarpaulin spread over it, and one of the crew put on shore with his box to guard it until the ship's return. In the woods we found dandelions, wild strawberries, azaleas, may and single pinks in full bloom, and wild and peony roses beginning to bud. The trees were firs, spruces, and birches, firs and spruces predominating. There was no cultivation except in small gardens. Potatoes and milk were on sale. In the early morning we met a raft with a couple of tarantasses, two horses, and a Russian family floating down stream. The vessel that was lightening on our arrival at Svirbeeva now made the attempt to pass the shallows, failed, and returned to discharge more cargo. Meantime, another steamer with Chinese passengers bound for gold mines was successful, and the *Vladimir Monomach*, accompanied by a boat and crew from the unsuccessful vessel to watch proceedings, steamed for the shallows. We had to cross the river. Alternately scraping the pebbly bottom, remaining fast, and raising the bows with our spars, we struggled through, only to find that there was as shallow a crossing three versts higher up. Fortunately the latter was safely negotiated without a hitch, and the captain blew several blasts on the whistle to warn the steamer at Svirbeeva that we had surmounted the difficulties. It was now 9 P.M., and we at once moored alongside a wood station after a very trying day.

MANCHURIA

A dense fog hung over the river on the morning of the 4th of June, and we did not get under way till 7.30 o'clock. An hour later, from out the whiteness glided an enormous raft of huge pine trees, with two huts for the accommodation of the twelve men and four women (all Russians) who were its occupants. The fog soon lifted, and we found ourselves in the midst of lovely scenery: on either bank were fairly high hills, densely packed with pine and birch. The log-hut stations of Sgibneva and Ignashina were passed at 11.15 A.M. and 2.50 P.M. respectively, and twenty minutes later we moored at the Chinese village of Mo-ho, which runs along the right bank of the Amur over a mile above Ignashina and is the most important gold camp in the whole of Manchuria. The population of the village probably does not exceed 500, and I noticed one or two uniformed soldiers in the crowd that thronged the river bank. I learned on shore that Mo-ho is the residence of a Taotai who superintends, and who was absent at, the mines 70 *li* (23½ miles) inland. The most prominent building was a Russian shop, over which flew the Russian flag. I visited several Chinese shops, which were poor, and I record here, with all due reserve, the results of inquiries made regarding the mines. I was told that there are about 10,000 gold-washers (placer-mining), and that 70 Chinese ounces of gold-dust represent the daily output; that there are 1,000 soldiers engaged in protecting the mines; and that this force, being insufficient, was about to be strengthened by another

ON THE AMUR

500 men. A simple calculation will show that 70 Chinese ounces of gold per day would barely suffice to pay 10,000 workmen, not to speak of the military force, so that either the number of miners was very much exaggerated, as I suspect, or the output of gold was understated. These were the figures given by the man on the street; but they are probably as reliable as any official utterance would have been. Much care had been taken to protect Mo-ho from the river, or more probably ice. A groin was built at the upper end of the village, and nearly the whole of the bank was faced horizontally for about twelve feet of its height with wooden planks. A large wooden Chinese house-boat in a state of decay lay on the top of the bank at the chief entrance to the village. There was some cultivation; potatoes, onions, wheat, and barley are grown; but millet, the great crop of Manchuria, will not, owing to the shortness of the summer, mature so far north. In one of the shops I noticed some very poor rice, which had been imported by steamer. It is a large wood station, and the bank was lined with logs for steamer use. Recent reports state that Mo-ho has since been occupied by the Russians and burned to the ground.

As it was daily becoming more evident that the *Vladimir Monomach* would not be able to ascend the Shilka, the passengers had been strongly urging the owner to make some arrangements for their conveyance from Pokrovskaia to Stretensk, and we were delayed several hours at Mo-ho while he proceeded to Ignashina to telegraph to these two places

MANCHURIA

as to the possibility of securing passages for us in another vessel. But this was not the only delay during the day, for before arrival at Amazar, a poor log station reached after a very shallow crossing, we bumped heavily on a snag or rock. A rush was made to the forehold and cargo laboriously hauled out; but it was only after a considerable time had elapsed that the ship was discovered to be leaking near the stern. Amid great excitement she was run along the Chinese bank and patched up overnight. We were now only about thirty versts from Pokrovskaia, and when we left at 6 A.M. on the 5th of June we expected to be there in a few hours. Judge of our surprise, therefore, when an hour and a half later we were told that our firewood was exhausted, and that there was no wood station in the immediate neighbourhood. We moored alongside the Russian bank, and the crew landed with saws and axes and proceeded to cut and chop trees into suitable lengths. And not only so, but a quantity of flour was carried on shore to lighten the ship. Had we known then, as we picked lilies of the valley and sweet peas among the bracken under the shade of pines and birches on the steep bank, that the passengers by the mail steamer, which had passed us on the 2nd of June, were starting that day from Pokrovskaia for Stretensk on a barge towed by a light draught steamer, I fear we would have mutinied. But fortune, which had hitherto been scant in its favours, did not desert us, for as we approached Pokrovskaia our eyes were gladdened by the sight

ON THE AMUR

of eight steamers, including the mail steamer, in port, and surely here we should be able to find transit to Stretensk. We came to an anchor at 1.30 P.M., and immediately a rush was made on shore by the passengers, who actually raced each other along the river bank for a place on the mail steamer. "Niet" was the answer, and I was just leaving another steamer where filthy accommodation was to be had, and where the bride and bridegroom had taken passage, when a friend from the mail steamer met me, took me on board that vessel, and introduced me to Mr. Bostelmann of the Chinese Eastern Railway Company, proceeding on business to St. Petersburg, who, he said, would find room for myself and family. Mr. Bostelmann not only advised me to get my baggage on board the mail steamer, but even assisted me in having it and my family transferred. During my absence in search of passages my wife had heard that accommodation might possibly be procured, in which case we should have to leave in a couple of hours, so she packed up all the baggage and dressed our little boy, who had been on his back for a couple of days with violent fever. When we went on board the *Vladimir Monomach* we found that part of the baggage had already gone; but my family were waiting with the balance for my return. We transferred them at once to the mail steamer, and I went in search of the missing packages, which were denied access to the steamer from the shore. The steamer herself was returning to Blagoveschensk; but a large barge, drawing only

MANCHURIA

one foot of water, was brought alongside and her passengers and their baggage transferred to it. After standing by my effects along with other would-be passengers for at least an hour, I was told to bring them on board. The baggage was all piled on deck pending the allotment of places, and, owing to the crush of passengers, it was some considerable time before this could be effected. The ladies and children were accommodated in a saloon set apart for them, while I succeeded, with the assistance of Mr. Bostelmann, in securing the stewardess's room for the sum of ten roubles. The gentlemen's saloon was already crowded, and some of our fellow-passengers in the *Vladimir Monomach* had to content themselves with places in the second class. It was preferable to being left behind at Pokrovskaia, with no certainty of being able to get beyond. Pokrovskaia, of which I saw little, except a large corrugated iron godown, with signs of cultivation between the village and the hills beyond, will haunt me to my dying day, and my reader will have learned ere this that comfort is not to be found on the Amur. Travelling as I travelled was not a pleasure: it was simply a struggle for existence. I have travelled thousands of miles in the interior of China, where I expected no comfort, and I was not disappointed; on the Amur I expected at least certain facilities, if on a less liberal scale than in Europe; but I found that if I wanted anything it had to be extorted by sheer doggedness and determination not to accept a refusal.

Not only was the barge crowded with passengers

ON THE AMUR

and baggage, but even the small steamer *Amur*, which took us in tow, was packed with a seething mass of humanity. Her decks and paddle-boxes were occupied by Chinese, Koreans, and Russians, who spent their days and nights in warding off with fans and umbrellas the living sparks which issued from her funnel. Every now and then there was a sudden commotion, with more violent waving of defensive weapons, showing that some one was on fire. Tow-boat and barge together carried about five hundred souls, and the draught of the *Amur* with her living freight was only a foot and a half. The shallowness of the Shilka in the spring of 1899 proved a great hindrance to navigation, and the Mail Steamship Company found it necessary to procure three light draught tow-boats and a number of barges to carry the mails and passengers from Pokrovskaia to Stretensk. There was still less water in the Shilka in 1900, and an extension of the Siberian Railway from Stretensk to Pokrovskaia is now talked of as a necessity. The river begins to rise in July; but so little time is then left before it is blocked by ice that the Shilka can never be looked upon as a commercial highway of any practical value.

We left Pokrovskaia at 8.15 p.m. on the 5th of June, and an hour later we had covered the last few versts of the Amur and arrived at the confluence of the Argun and the Shilka, whose combined waters go to make up the Hei-lung-chiang — the “Black Dragon River” — on which we had already spent twenty days. We passed from Manchuria and Amur-

MANCHURIA

skaia to the Trans-Baikal province, and as I gazed in the twilight on the bold, densely-wooded Manchurian bluff which overlooks the mouth of the Argun I tried to penetrate the darkness of the future, more intense than the darkness of night.

Leaving the Amur for the Shilka we said good-bye to Manchuria; but, as it is believed that the Siberian Railway will, in the near future, have far-reaching effects on the subject of this book, and on communication between East and West, I propose to continue my narrative to Stretensk and even to Lake Baikal.

The scenery on the Shilka is bolder and finer than on the Amur. The river frequently narrows to about one hundred yards in width, and is hemmed in by steep banks densely wooded with birch and pine. There was every shade of green, from the light-tinted grass in the gullies to the dark needles on the pines. Blocks of ice six to ten feet in thickness strewed the water's edge or still clung firmly to the banks. Early in the morning of the 6th of June we passed three steamers aground, and at noon we reached Povorotnaia, a poor log village fifty-nine and a half versts from the mouth of the Shilka, where we coaled on the opposite bank of the river. Here we found a small Orotchi tent, with a squat, flat-nosed woman and three children, the youngest, about three weeks old, nestling in a tiny cradle of birch bark, of which the tent itself was constructed. Higher up the Government stern-wheel steamer *Sungari*, one of the two vessels engaged in surveying, was at anchor. Herds of ponies

ON THE AMUR

were grazing on the banks wherever it was possible to gain a foothold. At 8 A.M. on the 7th we reached Chasovaia, $133\frac{1}{3}$ versts from Pokrovskaia. The scenery was still the same: the river winds about between steep banks, with always a seeming barrier of hills ahead. No provision had been made for the extra passengers taken on board the barge at Pokrovskaia, and early in the afternoon, as food was running short, a Cossack officer and a railway engineer went on a foraging expedition when we were taking in firewood at Soboliana. For fifteen roubles they secured a pig, which, although loudly objecting, was brought on board amid great excitement, the passengers cheering and the Russian officers joining in a welcoming song. It was served at supper the same evening, but I do not think that any of the English passengers enjoyed it.

We reached Gorbitza, $161\frac{1}{2}$ versts from Stretensk, at midnight, but owing to a dense fog were unable to proceed till 7.30 o'clock next morning. It is a large place with extensive log buildings and considerable cultivation. It is the centre of a gold mining district, and between it and Ust Kara, $54\frac{3}{4}$ versts higher up, there is said to be an Imperial Reserve of 12,000 square miles, part of which is worked by Government and the balance farmed out to miners. A Russian gentleman informed me that he would sooner throw his money into the Shilka than invest a rouble in Siberia. He told me that litigation almost invariably arose in regard to contracts entered into at such a distance from head-

MANCHURIA

quarters, and that the weaker had to go to the wall, and he inveighed strongly against the venality of Russian officials. A fracas had just occurred between Cossacks and bandits in the immediate neighbourhood of Gorbitza and eight men had been shot. It took thirteen and a half hours to accomplish the $54\frac{3}{4}$ versts to Ust Kara: at several places the current was very strong, and for hours we made little or no headway, in spite of the poling of passengers and crew. Two steamers passed down from Stretensk, one drawing three and a half, the other two feet. Ust Kara is a considerable village, with two large churches, at the mouth of the Kara River, a tributary of the Shilka. It is backed by flat-topped ranges of high hills, densely wooded, and, like Gorbitza, it is one of the most important places on the river. On the opposite or right bank it is faced by wooded rocky heights, showing near the water's edge at least ten feet of bare rock scarred and worn out by the current when the river is in flood. Ust Kara is the centre of silver and lead mines, to which, previous to 1898, political offenders were banished; but I am informed that only criminals are now sent to the Siberian mines, and that political offenders are dealt with in Russia itself. I have omitted to mention that at Verkhne Kularskaia, $17\frac{3}{4}$ versts below Ust Kara, we passed a large dredger, fitted with electric light and all modern appliances.

Shilkino, which we reached at six o'clock on the morning of the 9th of June, is the largest station on the Shilka, and has a population of about one thou-

ON THE AMUR

sand. Four versts higher up we were provided with a smaller but more powerful tow-boat, the *Ingoda*, and many of the passengers of the *Amur* were transferred to the upper deck of our barge. The scenery became bolder and more rocky until arrival at Botovskaia, when the country opened out and cultivation was general. We were now only sixty odd versts from Stretensk, and next morning, as we skirted the right bank of the river, the group of officers on our deck were saluted by soldiers on shore, who were bathing and drawing water for the camp, which lies on the outskirts of the town. Steaming above the terminus of the Siberian Railway, on the opposite or left bank of the Shilka, where we looked in vain for a train, we passed the pendulum ferry, worked by the current, and moored along the Mail Steamer Company's wharf at 10 A.M. on the 10th of June, twenty-seven days from Vladivostock, during which time, with the exception of the three days and eighteen hours we were aground in the Amur, we had caught every possible connection.

Stretensk is a very much smaller town than either Blagoveschensk or Habarovsk. Its population, which in 1897 numbered only 1,710, now amounts to about 8,000, and the increase is due in a great measure to the advent of the railway. The town is narrow, and runs for about a couple of miles along the right bank of the Shilka, sloping from hills in the rear down to the river. The houses are nearly all log built, and there are no prominent buildings as in the larger towns of Eastern Siberia. A Chinese

MANCHURIA

fruit-seller told me that there were several hundred of his countrymen in the town engaged as petty traders, servants, and artisans. The day of our arrival being a Sunday, the most of the shops were shut, and this may have strengthened the impression I received that Stretensk is a poor place. The result of the inquiries which we at once made was that the train from Lake Baikal would probably arrive that day, but that, owing to the state of the line, there was no certainty as to the times of arrival and departure. There was no rolling stock at Stretensk, and, as soon as the engine driver had secured a few hours' sleep, the train would be turned round. We at once laid in a stock of crockery, cutlery, and provisions, and during the afternoon sent our baggage across the river to the railway station, intending to spend the night in the barge. Many of our fellow-passengers passed the night at the station. There was little sleep for us that night. Half-an-hour after midnight I saw the train steaming into the terminus, and two hours later we were at the station and had secured tickets for Irkutsk. Much time was wasted in passing and paying for extra baggage, and when we went to secure places on the train, which was made up of fourth-class carriages, each certified to carry forty-three passengers, with bare wooden seats for sleeping accommodation, baggage waggons, and horse boxes, we found that the fourth-class carriages were already filled by those who had spent the night at the station. The railway officials made no attempt to assist us, and it

ON THE AMUR

became simply a question of "Help yourself." We put the ladies into half of a baggage waggon, and four of us took possession of a guard's van which we held against all comers. The guard was duly squared, but it is really wonderful how often he was changed between Stretensk and Baikal, and how persistent each successor was to occupy his room until he had been similarly disposed of. At every stopping place one of us had to keep guard, and exclude, sometimes by main force, would-be travelling companions. Some of our friends who had spent the night on shore at Stretensk did not turn up till morning was well advanced, and they had to content themselves with a box certified to accommodate forty men or eight horses, and, in spite of all their exertions, they were unable to retain sole possession, men, women, and children having been forced upon them.

The railway stations at Stretensk and Lake Baikal are respectively 1,450 and 1,561 feet above the level of the sea. The distance between them is $1,035\frac{1}{2}$ versts, in the course of which the junction of the Trans-Manchurian Railway now under construction and the Trans-Baikal section of the Siberian Railway is effected at Kaidalovo, $252\frac{1}{2}$ versts from Stretensk, the Yablonoi Range of mountains is crossed at an altitude of 3,182 feet above sea level, and the passage of the river Selenga is accomplished by an iron girder bridge of six spans. The Trans-Baikal Railway was begun on the 23rd of April, 1895; but, owing to disastrous floods, which swept

MANCHURIA

away a considerable part of the line in the neighbourhood of Nerehinsk in 1898, it has only just been completed, and, although one train leaves either end daily, it is not yet in proper working order. As far as Chita, which is about 360 versts from Stretensk, the line follows closely the left banks of the Shilka and Ingoda rivers, and, where rock cuttings have been found necessary, the track is so narrow that the cliffs appear to overhang the line. The result is that it could never be duplicated except at a very large expenditure, during which the present track would be rendered useless. In many places, on the other hand, the embankment is built of sand and shingle, and the sides are pegged diamond-shape and planted with young willows to prevent slipping. Here the train was slowed down to a walking pace. The village of Kaidalovo is some 107 versts to the east of Chita, and at this point the Ingoda River is crossed by an iron girder bridge of two spans, with a total length of 560 feet. The bridge was all but completed; but the scaffolding underneath one of the spans had not been removed, and railway material was being transported across the river by a pendulum ferry. The track as surveyed from Kaidalovo to the Manchurian frontier measures $324\frac{1}{3}$ versts; but I have already referred to this line in a preceding chapter. Between Stretensk and Chita cultivation was general, and there were large tracts of grassland, with herds of ponies, cattle, and sheep. Beyond Chita the line ascends the eastern slope of the Yablonoi Range through a forest of birch and

ON THE AMUR

pine, and it was with great difficulty that our train, weighing about 200 tons, was dragged and pushed by a couple of locomotives over the highest point of the track at Gongota. Before reaching the summit there is a covered rock cutting of no great length. The descent to the west of Gongota is easy for a distance of 255 versts, the track following for the most part the right bank of a stream—the Khilok—a tributary of the Selenga, and at one place passing through a short tunnel. Leaving Khilok it ascends to Kisha, whence there is a steep descent to Gorkhon, and thereafter a gradual dip to the river Uda, another tributary of the Selenga, crossed by a two-arched bridge, and to the town of Verkhne-Udinsk on the right bank of the latter river. Verkhne-Udinsk is a prosperous town with about 8,000 inhabitants, and connects with the Kiakhta Road, through Mongolia, to China. At the station I noticed a number of Buriats, who wore short queues and were dressed in the long wadded coats and official winter hats of the Chinese. On leaving the town the railway crosses the Selenga by the six-arched bridge mentioned above, and, following for some distance the left bank of the river, goes west by south through well-cultivated and well-wooded country to the village of Mysovaia, on the south-eastern shore of Lake Baikal. We left Stretensk at 7 A.M. on the 11th and reached Mysovaia at 9.45 P.M. on the 13th of June, the journey thus occupying sixty-three and three-quarters hours, an average speed, including stoppages, of nearly eleven miles an hour.

MANCHURIA

It may seem unfair, in the present state of the track, which, except at rock cuttings, is ballasted with gravel and sand only, to cite this speed; but, when it is considered that the rails weigh only 48.6 lb. to the yard, necessitating the employment of light engines, and that the gradients are frequently as steep as one in sixty, it would appear highly improbable that the Trans-Baikal Railway can never cope successfully with heavy traffic or develop a high rate of speed.

Before we reached Baikal it was rumoured that a storm was raging on the lake and that the ice-breaker on which we were to make the passage across had not yet arrived from the opposite side, and snow on the mountains ahead gave support to the rumour; but as we approached Mysovaia in the twilight the electric lights of the *Baikal* shone on a placid lake and the ripples kissing the shore. A marriage was being celebrated on board the ice-breaker, and we were kept in the station at Mysovaia from 9.45 P.M. of the 13th till 2.30 A.M. next morning, when we were shunted along the wooden pier, at the end of which the *Baikal* was moored. A wild dash was made for the steamer, and for a time passengers and baggage were inextricably mixed up, each one struggling to get his effects on board and secure a place for a few hours' rest. Although the *Baikal* is constructed to carry a whole train, our carriages were not shipped; but at the moment the vessel was not in proper working order, and, moreover, she is said to roll in heavy weather to an angle of 30°. The *Baikal* was

ON THE AMUR

built by Messrs. Armstrong, Whitworth & Co., and launched in June, 1899, at the village of Listvianichnaia, on the north bank of the Lower Angara where it leaves the lake. She is a vessel of 4,200 tons, and her measurements are 290 feet long and 57 feet beam, with a draught of 18 feet at the bows and 20 feet at the stern. She is built of steel, and is fitted with three triple expansion engines, with an indicated horse-power of 3,750. She has four funnels. Her speed was to be twenty and a half versts an hour, but I was told on board that she had never exceeded ten knots. This, however, may be accounted for by the fact that the starboard engine has broken down, and that of the three propellers (one at the bow and two at the stern) only two were working. Nor can repairs be effected until the floating dock now in course of construction is finished two years hence. I was told that the *Baikal* could cut through ice over four feet thick at the rate of several knots an hour. She crosses the lake three times a week, and has on an average about eight hundred passengers bound east. We left Mysovaia at 4 A.M., and, after a motionless passage of five hours, arrived at Baikal-ozero on the left bank of the Lower Angara, opposite Listvianichnaia. During the crossing we had a magnificent view of the snow-clad Khamardaban Mountains to the south-east, rising to a height of 3,000 feet above the lake. It has been found that Mysovaia is not a suitable harbour for the *Baikal*, and a railway forty-five versts long is in course of construction to a point further south

MANCHURIA

on the lake, where there is deeper water, and on its completion the harbour will be transferred to that place. This does not speak well for the speedy construction of the line round the south of Lake Baikal, and I heard the opinion freely expressed by Russians that, in view of the great physical obstacles to be overcome, this line may have to be abandoned.

We saw little variety of animal life during the whole of our journey. Crows, magpies, and sparrows were common enough; ducks were likewise plentiful on the Amur; the note of the cuckoo was frequently whispered from the primeval forest; a pheasant at Raddevka; and the song of the lark as he soared above the Siberian plains — these were all we saw or heard.

My object in carrying my reader with me to Lake Baikal was to point out the point of junction of the Siberian and Manchurian lines, and, as that has been accomplished, I have only to add that after a number of adventures we reached London on the morning of the 2nd of July, travelling from Irkutsk to Krasnoiarsk, Omsk, Cheliabinsk, and thence by way of Moscow, Warsaw, Berlin, Ostend, and Dover to London — a journey from China to England of fifty-nine days.
